the receiving radio will only accept so much deveation (misspelled) and will clip it...   thus making your signal break up....

Jack when are you going to learn. Collinear in the dictionary
simply means in line.

In the antenna world it's a little more complex. It means at least two
half wave elements are in-line, and are fed in phase.

You use the simple definition. Why?......I'd love to answer that but
I will leave that for someone else.

Just answer this. Why is the A99 advertised as a 9.9dbi antenna
in CB publications and also advertised as a 3dbi antenna in Amateur
publications? Is it that much more effective at 27mhz?

Well bring your ass to Memphis then Duck, we will grudge match after the break for $100 bucks, Your M80, I'll run a TS 250. I dont care what voltage you run, I have 2 M80's, 1 M40 and these two boxes do no more than an older Texas star 250, or 1 pill. Buy you some good test equipment and you to will see this.
I am not ragging Dave, I ran his equipment for years, and that was all in keydowns, I just know that these two Texas star's mention will run damn close with his at 14 volts.

Does anybody happen to know the specifications for a Super Scanner Antenna (db gain and power handing)? Friend has one and does not have a spec. sheet.

Thanks

Gary

Ok, I'm gonna repeat myself here. Some time ago I wrote this NG that I was in fact the guy that gave the ground plane kit to all of you. Naturally, I don't claim to have invented ground plane radials but I did in fact give this idea to a certain manufacturer and they ran with it until you have what you have now.

The radials I had made were to answer a small tvi problem a customer of ours had. I figured I knew why the Antron was doing it and thought the problem could be abated, or nearly so,with some decoupling. I also thought maybe a small change in pattern would also help get more range locally.

In this particular case I was correct. I minimized the tvi / phone rfi issue for my customer and he also found a slight improvement in his local coverage into certain areas.

Not unlike Dr. Freud's couch, these ground plane radials were never meant to be a business unto themselves.

In explaining this before, I said not everyone would notice the improvement in range or tvi reduction. The change in pattern is subtle in most cases and would only be noticed by gaining an ability to talk a little better into areas that were beforehand very marginal. These kits were not what you'd call "a linear in a box,,,just add water".

I also explained that most of today's halfwave or bigger antennas did not absolutely require a gpkit as the halfwave has the proper current distributions already.

So for those that tout the groundplane kits as the end-all be-all of antenna accessories...forget it.
For those of you trying to call it a hoax..you can forget that too. There is a purpose to them other than a gimmick and money.

As for me? I forgot it too 'cause I never did get even a thank you from any of those manufacturers who picked up on this and went with it. Next time I'll be a bit more careful of what ideas I give out.

Dearest Dwight,

I'm half wondering if you are trawling for flames on this one. I assure you it is possible to work the world on very modest equipment on 11m. I have spoken from this continent to Asia and the Pacific rim many times. And I've done it with, dare I say it, legal equipment. I've spoken to Australia and Japan on several occaisions. I do admit that I have never spoken to China nor Antarctica though. I don't even know if China has many CBs. Most people there are saving up for a new bicycle, not a CB radio! And most people in Antarctica (all 27 of them) are probably busy working on scientific research anyway.

MC

Greetings!

Good points Bob.

This subject of trimming gets way too complex for the average CB'er and may hinder their development.

As I dabble in this stuff, most of what I've learned isn't going to do the average Joe a d*mn bit of good aside for the obvious.

Life around a CB should never be difficult. Some people seems to argue finer points when the whole outlook is simple.

"They focus too much on the tree and not enough on the forest around it" - it's a good motto, and the whole threaded mess fits it.

I'll always say that if it works for you, then use it.

If performance doesn't seem to be like it should, then let's talk.

I don't know how I got dragged into this mess, except to defend the special considerations that require such a technique.

When people use 18' just for their own reasons, then I'd prefer to leave them to their desire.

Besides, if they only needed 12-14 feet to reach the radio, and the connections are pre-molded, and soldered - why bother trimming up the excess just to look good?

My asked questions' have always been, "No, it works fine just like it is. You can leave it alone."

You don't obtain any extra "gain" from removing 4 feet.

You may suffer problems with a poor connection later on, because you had to re-do a connection.

A proper location, good mount, and soldered and sealed connectors always provide support so you don't have to concern yourself if you have an "Apparent" or "True" SWR problem.

The CB'er would rather worry about other things,
they may not all have PhD's in Physics.
They don't need one. ;-)

I'd rather seem them happy with what they have.

When problems *do* arise, I'd like to be there to help.

While Dancing with the Mouse on Sun, 14 Nov 1999 22:57:45 -0500, the Modem interrupted with an MNI from "Bob <bob@bob.com>", and the MotherBoard buffered this to Video RAM:

:+> Hi,
:+>
:+> Well, this discussion is getting out of hand....I think everyone
:+> is just going crazy and talking about different things.
:+> Its come to the point where it seems everyone is just confused.

Howdy Bill,

I disagree. (ducking) You could attach 6' radials to a CB antenna and improve the performance. However, that antenna would have to be specifically designed for them - the A99 isn't. Nor is any antenna I've seen lately come to think of it......

MC

Removing R131 will make the radio overmodulate. So leave the radio screwed together and go play with something else. There's a good boy.....

Take the microphone back to the store and get your money back. Not that there's anything wrong with it, but I'm sick of noise toyz on the air.

If Cobra says that you shouldn't use a power microphone on the radio it is because they've engineered it not to need one. Sounds wild, but the people who design the radios actually know more than the CBers who buy them.

If the microphone that came with the radio isn't adequate, I suggest you take it too back to the store and demand your money back. Tell 'em that a guy calling himself MC 10kW Jesus said so. That oughtta carry a lot of weight.... :->

Greetings!

Thank you. I thought there was few more parts, but you are correct.

My memory needs post-it note pads!

Too bad I fixed and gave it back, it's the one I had the headaches over. I remember them asking to have it defeated and do some work. After jumpering the ST switch I set about working on it, I know theres' some other stuff that these two caps address, but the radio is back in their hands. And they like the work. So, I'm sure someone else will get their fingers in it and post some more mods out here soon.

I just wish I remembered more of that had to be done. I do remember it took the mods rather well. Mostly modulation and some re-work of the driver/final section, and it was up to snuff and good enough!

4 months and a Divroce does that to people...sigh...

While Dancing with the Mouse on Mon, 15 Nov 1999 19:28:15 -0500, the Modem interrupted with an MNI from ""Hank Aaron" <REMOVEjeffherrings@hotmail.com>", and the MotherBoard buffered this to Video RAM:

Greetings!

I thought those silly little radials were for decoupling coax so you
didn't have to wind an extra 8 turns or so further down the mast to
reduce coax currents.

Whats up?

While Dancing with the Mouse on 16 Nov 1999 05:55:31 GMT, the Modem
interrupted with an MNI from "billn@peak.org (Bill Nelson)", and the
MotherBoard buffered this to Video RAM:

Greetings!

Check your options and make sure you use UUencode, most Newsreaders tolerate MIME - it just shows extra garbage. You might want to disable the HTML formatting too.

You'll see "=" signs at the end of your lines, this is so that MIME readers don't "truncate" and CR+LF - instead it "wraps". Otherwise we see "=20" as an (esc) sequence.

Some ISP servers don't filter that, e.g. - like AOL. At least they don't re-format for their own users, instead they pass thru. Problem

```
is with literal strings and how they're interpeted. Some routers will
re-format the message so it's viewable - albeit full of extras, for
both types of encoding.

Those that use UUencode see a double message.

UUencode? WYSIWYG - and you set the default font for your own eyes.

Just wanted to let you know what we were seeing.

Greetings!

Uh oh...

This radio, I believe, if you see 5-pin DIN, it's usually a Condeser element type that takes power from the radio.

"Moo"? Well, <chuckle> thats a good way to put it.

It powers the element. And also sends audio down the same line. It's decoupled from the bias circuit inside, but many dynamic or power mikes can't tolerate this type of setup. It'll squeal, or place a voltage on the line that will muddy your audio because it's charging a cap that is used to block DC voltages from getting into the mike and affecting it.

While Dancing with the Mouse on Tue, 16 Nov 1999 20:28:47 GMT, the Modem interrupted with an MNI from "jkittle117@my-deja.com", and the MotherBoard buffered this to Video RAM:

:+> I am wanting to wire up a ParaDynamics Power Mic (echo and noises) to
:+> my Cobra 23 Plus (40 channel plus 3 weather bands). According to the
:+> Cobra website, they do not recommend putting a power mic on this unit.
:+> Does anyone know why? I have been having problems wireing it up to the
:+> 5-pin din connector that the radio needs. I "thought" I had it
:+> correct, but the radio would "moo" when i keyed - it gave a high pitch
:+> tone that would become low picth (imagine a bomb dropping).
:+>
:+> Any ideas?

>

Perhaps a poor choice of words on my part. I am not in disagreement with you about VSWR. I agree that the length of feedline does not affect the VSWR of the antenna. The point I was making is that you never really know what your antenna's VSWR is if your feedline is anything other than an electrical half-wave when your antenna is other than 50 Ohms (which all quarter waves are). The exception being a 1/4 wave with angled-down ground planes. Once you've removed the coax variable from the equation, as only a half wave will do, you can focus on pruning your stinger for the 1.3:1 VSWR.

Now if you'll excuse me I must go play with my stinger. :->

Greetings!

It was just a bear. Once you we're able to make it work straight forward, it performed like all the other radios.

The thing I liked about ST, which led me into this mess with the radio I got to work on, was it's novel use of a compandor. To dis-able the ST, I just jumpered at first, then payed attention to what it was doing.

...what seemed like hundereds of hours later and constant references to electronic references in "Audio sections"...

... I finally came to a concussion, er-conclusion, that ST for what it is, needs to be made "Globally" implemented for it to really work like it should for others to hear the benefit. Too bad the FCC didn't allow for a PL to be broadcast so that these ST radios could have the full benefit of detecting the PL and engaging during such a transmission from another ST radio to hear the true benefit.

I actually had two ST-models, one a Cobra 29, and one the 148.

The 29 I simply re-overhauled, fixed the ST and sold it at a local Flea market.

I actually lost money on it. It cost me 5 bucks at a Garage sale, but after all the work I put into the '29, I only got 30 bucks. This radio was the one I originally got, and had to re-connect the ST feature to make it work. [Or at least undo what they did, and re-create the original and then fix that.]

Once I got the '29 working, the 148 came into play. It still has the ST circuits intact, only bypassed. They use the ST button for a channel jump switch.

But, to give credit, the joy of ST was the "expansion" after it got into the other receivers' ST. Very good fidelity, but sounded a lot "flatter" on another radio that didn't have ST.

This is the reason why ST is such a bane. It sounds great when two radios use it, but terrible on other radios not equipped for decoding it.

As far as mods? Well, be conservative at first. Don't go all out for doing it all at once. Take your time and use the radio in-between mods This way, if someone complains, you only need to re-do one mod, and not have to re-fix everything else.

Believe me, I've been there.

While Dancing with the Mouse on Tue, 16 Nov 1999 20:06:03 -0500, the Modem interrupted with an MNI from ""Richard Camarata" <rtcamarata@mediaone.net>", and the MotherBoard buffered this to Video RAM:

Thank you get some! I known the box will run on two alts and I know it will run better with more alts. Your right I most likely wont be in any keydowns unless some mud ducks around me want to give it a try. Since there arent many mobles bigger then 16 pills by me I dont see it happening. All I want to be able to do is talk and be heard with a fairly strong signal. That is what I promise I will do.

Uh, provide some documentation of this please.  Last I heard, the local
police cannot do anything about FCC violations.  They might be able to
use "public nuisance" laws - but that is all.

: > : "reduced efficiency" that you describe is the effect of
: > : power reflected into the transmitter.
: >
: > Read a text on transmission line theory - rather than going by
: > popular belief.
:
: Why don't you quote me a chapter that disagrees with what I say?
: It all comes from the book.

The heating is a consequence of the mismatch - true. We just are in disagreement about the actual cause.

Radio Amateur's Handbook (1983 edition - since that is what I have handy):

"Quite often, it is mistakenly assumed that power reflected from a load represents power "lost" in some way. This is only true if there is considerable loss in the line itself and the power is dissipated on the way back to the source." (Page 19-2)

That is what I found with a quick search. There is probably more, but it is not as easy to find in the newer handbooks than the old.

My references from my Transmission Line Theory classes are in a box somewhere, or I would haul them out to quote "chapter and verse". They are all VERY explicit on the matter.

My apologies for not being able to document this more completely. The whole subject is counter-intuitive.

: > The end result is the same - the finals get hot. It is just the
: > mechanism is different than what you would think using simple
: > logic.
:

: Your analysis is flawed. You describe it as if no power goes up
: and down the transmission line. You are using a "lumped element"
: analysis for a "distributed element" system. This is a common
: practice for simplifying a circuit for analysis but breaks down
: under certain conditions such as this.

Nope. Although lumped elements would give the same result, it is not necessary to assume them.

The only way you could assume lumped elements would be to model the transmission line with resistors, inductors and capacitors. So the resistance would NOT be connected at the transmitter output, and the transmitter would not see an infinite impedance.

: For example, if I transmit into an open ended transmission line
: that is 1/2 wavelength long, the transmitter sees an impedance of
: infinity at the coax input. Despite this infinite impedance,
: current does flow into the transmission line all the way down
: to the open end where it is then reflected back. This can be
: proven with a power meter. I can measure power all along
: the transmission line.

: In fact, the transmitter would not see the infinite impedance
: unless power were being reflected back.

On the other hand - if the coax is long enough - then you will not see all the power back at the transmitter - even though all of it is reflected.

: Now, for some circuit design analysis, an infinite impedance
: could be substituted for the transmission line here. But at
: an infinite impedance, no current would flow. However, I can
: prove that current does indeed flow because I can measure it
: with a power meter. The reality is that current simultaneously
: flows in both directions and the net current is zero.

Well, the net current is not zero - but close to it for relatively short lengths of low loss transmission line. So what?

As a simple illustration. Assume that you have a length of coax with 3 dB loss for that length (cut to a multiple of 1/2 wavelength). If you feed 100 watts into the coax - only 50 watts appear at the open end, where it is all reflected. When that power gets back to the transmitter, it is down to 25 watts. Instead of your meter at the transmitter reading an infinite VSWR, it reads about 3:1.

Nowhere, but at the open end, will you get an infinite VSWR reading.

Exactly. The proper method for a round table is for everyone to tune their
transmit to ONE station. Now everyone but the one station can use their
receive clarifier to make them all sound right - if one does, then all will.
The "One" station now tunes his transmitter so he sounds right to the other
stations, then retunes his receive clarifier to make everyone else sound right.

I always heard that the SWR could only be measured at the base of the antenna.
Is this true?

1. Why in the world would I want to talk up there? In my area, 2 meters is full of snobby holier than thou types who think they're God's gift to radio. They were actually planning to go into a neighborhood where one of my CB friends is (who runs no power by the way, doesn't need to, has a set of stacked maco laser 400's on top of 90' tower) and deliberately create interferance on the neighborhood TV's and such so that they could get the guy in trouble. As I left I asked them why they would want to frame a guy like that. The apparent spokesman for the group responded with a laugh "Because we can." Of course I warned every CBer I knew.

2. The general atmosphere on the ham bands I've listened to is stuffy and boring.

3. I prefer to avoid having my name, address, and such posted where anyone with a scanner and an internet connection can hear me on the air, write down my

callsign, and look me up for whatever purposes they might have. It's easy enough to get info on people as it is. I have no intention on making it any easier.

4. On CB the vast majority of people are friendly, helpful, and considerate. If someone thinks your radio sounds off or something they'll tell ya and will gladly offer any assistance they can to help get it right. The other night a dude that frequents 2 meters came down to CB and started telling people that their radios sounded strange. When I or one of the others asked what was strange about it (heck, if my stuff isn't working right I want to know what the deal is so I can either fix it myself or give a good description to the local tech if the repair is beyond my skill) he refused to say. He said he'd only help with such if we paid him $$$. What's up with that? After a little playing around we determined that the problem wasn't in any of our radios, he was actually 4 kc's off frequency. I have an external freq counter so I know I am on freq, yet, to pull him in clearly we had to tune down 4kc's. We told him this and he left the channel. I guess he was shamed.

The point I'm trying to make is this. In this part of Alabama, most of the hams are basically CB rejects. They didn't have the social skills to operate in a friendly manner so in an attempt to set themselves above those with whom they weren't able to interact with due to those weak social skills they went out and got a ham license. Now on the rare occaisions they show thier faces on CB they act like radio gods or something. Why would I want to hang with those people? I'm perfectly happy to talk to the people who are on CB. Even those who have king of the hill syndrome with the megawatt amps and such are basically good folks. I'll choose good folks to hang out with over assholes any day.

That wasn't the reason for the post. That was a response to a question. I
didn't care to get the sensitivity down. It has its purpose. That is what I
was trying to point out. Since I run a shop I do know that.
The people that use the radio are now prepared for it. Some will buy it and be
unhappy. Since this shop does everything with schematics instead of lucky
guesses we choose not to pick a pot or diode or resister and turn, clip or
snip. I was just informing a prospective buyer of the close limitations of the
radio.   Thank you for your question.

  Exactly NOT. Anytime a tuner has separate controls for TX
and RX it opens the door for all sorts of (hows that?), (is that any
better?) ect.ect. If you added multiple radios that all have separate
TX and RX capabilities and put them in a roundtable then what do we
get? We get a absolute guarantee of what the topic of conversation
is going to be.
   RF tag is best eliminated by locking a receiver and transmitter
together. Then when you adjust your receiver to some ones
signal you automatically put your transmit in line also. End of
tag.

Hello Group,

I have a Uniden Madison base that is very clean, and in good to excellent condition that I have decided to put up for sale. It is one of the last models Uniden manufactured with the "digital clock", and also has the external speaker. Everything works on this unit including the clock, meters, lights, etc. It also has "extra channels" and talks very loud. I will be listing it on EBAY sometime during the next week, but wanted to offer it to someone n the group first. I am asking $150 plus shipping (which should be around $10).

Drop me an email if interested :-)

I've got a ParaDynamics Power Mic with Echo and 8 sounds (I think it is). I'm trying to wire it up to a Cobra 19XS. I had it correct "i thought" for a while, but if i got too loud, the thing would cut out. Does anyone have pinspecs for this thing?

Thx in advance

Ok, I see what you're getting at. As long as we have 6 Khz "channels",
you can have a USB and an LSB signal on the same channel, since they
fall on either side of the "center" of the channel.

If we were to make channels 3 Khz wide, then yes, you could only have
one mode on each.

Actually, there is no real reason to have both SSB modes, if you do 3
Khz channels, there is no advantage to it. Having both sidebands was a
good way of "channel doubling" our current 6 Khz channels.

If the mod is done right, I've never seen a situation where the receive
frequency and transmit frequency are not synchronized. Like you said,
the voltage reference is the most important point.

But what usually happens, that causes clarifier "walking" across the
channel, is that people have their own "fidelity preference". One guy
may like the sound a little higher pitched than another guy. Some guys
are alwyas "touching up" the sound, and end up making the other guy
readjust for his preference, and the cycle continues.

The ideal situation is to have a synchronized main clarifier, with a RX
only fine clarifier for "audio preference tuning". The RX-only clarifier
MUST be adjusted to be precisely synchronized with the TX in the center
slot position, or else initial tuning will be difficult.

I agree. Initially, at least, you need the ability to "net" everyone together onto the same frequency. Afterward, you could shift the RX to "touch up" the other stations' sound, to match your desired fidelity.

Considering the wide variation in frequency counter accuracy, and radio tuning, it is virtually impossible to "synchronize" a TX frequency adjustment to another station, without their feedback.

Funny, in my area, 2 meters is populated by people who have "normal" conversations. If the fact that they are unreceptive to "CB-type" banter, makes them "snobby", then I'm snobby too, since I don't like "CB Banter" on ham or CB radio. We'd like 2 meters to remain clean and free from show-off types, that are only interested in (trying to) impressing people.

> They were actually planning to go into a neighborhood where one of my CB friends

Most hams that I know, couldn't care less what's happening on CB radio, and most don't even own CB equipment, unless they also use CB radio. The only time that they become concerned with CBers, is when they cause interference. If those guys did what they did, just for the heck of it, then they are just as bad as the worst of the CBers.

Only people with paranoid tendancies have a problem with this. If you have nothing to hide, then you should have nothing to fear.

>
> 4. On CB the vast majority of people are friendly, helpful, and considerate.

In my area, the helpful people are few and far between (Unless you need a lesson in vulgarity, then they are VERY "helpful"). Considerate? That's a joke. Maybe if they like you, they'll let you talk on "their" channel.

> If someone thinks your radio sounds off or something they'll tell ya and will
> gladly offer any assistance they can to help get it right.

It's true that there is never a shortage of opinions, when it comes to on-air diagnosis. The problem is that most of the "helpful ears" don't have a clue as to what they are listening to. I've heard people tell guys with ailing radios, that they are "off frequency" when the problem was clearly one of excessive transmitter FMing. Warbling on SSB was written off as a "bad mike" etc etc. When you run on a band where the majority of operators are technically illiterate, or worse, know just enough to get in trouble, you can't trust the "advice" that you get.

What I want to know is how do you guys know who the hams are? Do these
guys break on the channel and announce that they are hams? Or do you
like to keep a dossier on every ham in the area?

Personally, I wouldn't know who the hams are on CB, in my area(unless I
knew them personally). They sound the same. I could make an assumption
that the more knowlegable or less obnoixious ones MIGHT be hams, but it
would only be an assumption.

>

> folks. I'll choose good folks to hang out with over assholes any day.

So let me get this straight, if I read you right. You're saying that
certain people could not cut it with CBers, yet they were able to fit in
in the ranks of hams? Sounds a bit backwards to me. To get along on CB,
all you need are the social skills of "He-Haw", and a bunch of like
minded people. If, as you've perported, hams are "stuffy", it seems to
me that you would need a much more refined social skill set to get along
there.

I guess it the same reasoning that makes parents "un-cool" to their
teenaged children. Reserved, sensible, logical, and responsible, have no
place in party city.......

It depends. If you are using a power mike to increase the audio sensitivity, or to make up for a lack of gain in the FM modulator, then they are fine.

Keep in mind that most quality FM radios have the equivilent of a "modulation limiter" to keep the deviation from exceeding the max level (usually between 3 and 5 Khz). If the stock mike can fully modulate the radio, then any extra audio from a power mike will be wasted.

Desk type mike often have better tonal quality than handheld mikes, and they are often amplified as well. If the gain is set properly, they can be used with no problem. Although, from personal experience, the D104, is usually to tinny sounding on FM. One of the older Turner desk mikes tend to sound better.

No. Assuming that you are using 50 ohm coax and know it's length and velocity factor, you can measure the complex impedance with an antenna analyzer and calculate the actual antenna impedance on your Smith Chart. The easiest way for most is to just use 1./2 wavelength of coax, taking velocity factor into account.

well i have been saying that since i hit town, imagine my consternation when
i first came on ths news group and to my surprise people were talking about
how great these damn things were and that flew in the face of my twenty some
odd years of experience listening to people who had these things , bitch
about how they thought they were junk and wished they never had bought them.
oh well, i guess there is a sucker born every minute,...icm out....

Everything goes....

All the CB hardware in the shop is for sale.
$700 takes it all. No parts sold seperately.

Pictures and info on the site at:

http://www.efjdevices.com/sellout.htm

It will do ok as is. It will do slightly better with the decoupling
radials. As they reduce the rf on the shield of the coax. But 6 ft
long??? Kinda weird... I've never seen the ads, or had one, but I've
always considered the antenna a 1/2 wave vertical, center fed, and the
radials a decoupling section. It is a decent antenna, but not a miracle
worker as some of the gain reports would suggest. MK

I'm selling a Uniden PRO640e AM/SSB mobile. Its in like new condition,
100% working order with NO burnt out LED'd or lights. If interested
e-mail me your best offer or will take an Eagle Sidewinder as trade.
Thanks.

Hi,
Looking for a web site or page for info on the Eagle Apache
240 AM/FM radio.   Looks interesting for $60, but not sure
it will do what I want.

thanks,
Joe

I have an Astron 12A power suplly and was wondering if there was any way to get the amperage up to about 20 amps. Or would I be better off buy a new power supply? I am using it to run a Texas Star 250 amp and my mobile radio for my base. Works great with the amp on low but have a hard time driving it on med. and hi with the radio on. Any help would be great or if anyone knows of a good amp for sale cheap E-mail me.

I agree.

Remember that the SWR measurement is fundamentally a measurement of
the reflected power versus the forward power.  Try not to let the
nodes, waves and other terminology confuse the issue.

Except for transmission line losses, which are usually relatively
minor, the power in your transmission line at your radio will be the
same as it is in the transmission line up at the antenna.  There is
really no need to measure the SWR at the antenna.

>
> "Quite often, it is mistakenly assumed that power reflected from a load represents power "lost" in some way. This is only true if there is considerable loss in the line itself and the power is dissipated on the way back to the source." (Page 19-2)

That is a correct statement and it doesn't disagree with anything that I have said.

Power reflected from a load is, indeed, not necessarily lost. Hoever, if this reflected power impinges upon a 50 ohm impedance (the typical output impedance of a CB radio), it is dissipated and lost as heat. The only way to salvage this reflected power is to re-reflect it back to the antenna. This must be done by presenting the reflected power with some other impedance (e.g. with an antenna tuner or by retuning the transmitter output circuitry). The ideal impedance where 100% re-reflection occurs is the complex conjugate of the impedance seen looking into the radio end of the transmission line.

> That is what I found with a quick search. There is probably more, but it is not as easy to find in the newer handbooks than the old.

>
> My apologies for not being able to document this more completely. The whole subject is counter-intuitive.

If you can find a chapter that *disagrees* with what I say, bring it on.

[snip]

> : Now, for some circuit design analysis, an infinite impedance could be substituted for the transmission line here. But at an infinite impedance, no current would flow. However, I can prove that current does indeed flow because I can measure it with a power meter. The reality is that current simultaneously flows in both directions and the net current is zero.
>
> Well, the net current is not zero - but close to it for relatively short lengths of low loss transmission line. So what?

You seem to treat it as if no current flows (what you get with a lumped circuit analysis), but it does. It can be shown with a power meter that power does go up and down the tranmission line.

You say that the transmitter is merely operating "less efficiently" as if the power never gets out of the radio. There may be no net power flow but full power does indeed go all the way up the transmission line and back into the transmitter.

> As a simple illustration. Assume that you have a length of coax with
> 3 dB loss for that length (cut to a multiple of 1/2 wavelength). If
> you feed 100 watts into the coax - only 50 watts appear at the open

> transmitter, it is down to 25 watts. Instead of your meter at the
> transmitter reading an infinite VSWR, it reads about 3:1.

Yes. No argument here. I think you're getting off track here. For this example, the difference of opinion is in what happens to that 25 watts that gets back to the transmitter. For a transmitter with a 50 ohm output impedance, the 25 watts is terminated and dissipated as heat (not re-reflected).

> Nowhere, but at the open end, will you get an infinite VSWR reading.

Yes, for your lossy example. I was using a lossless scenario because I didn't feel that transmission line loss was necessary for my point.

<<<Why in the world would I want to talk up there? In my area, 2 meters is
full of snobby holier than thou types who think they're God's gift to radio.>>>

Here in So Cal some of the repeaters border on sounding like CB. Maybe you'd
feel more comfortable here.

<<They were actually planning to go into a neighborhood where one of my CB
friends
is (who runs no power by the way, doesn't need to, has a set of stacked maco
laser 400's on top of 90' tower) and deliberately create interferance on the
neighborhood TV's and such so that they could get the guy in trouble. As I
left
I asked them why they would want to frame a guy like that. The apparent
spokesman for the group responded with a laugh "Because we can." Of course I
warned every CBer I knew.>>>

Hey, that's pretty reprehensible. If you know who these hams are and when,
where, and what frequency they plan to 'create interference on', why not gather

some evidence of their wrongdoing and lodge a formal complaint with the FCC?
Send a copy to the ARRL and your local police. Forward it in email form to

Riley Hollingsworth. Call the local newspaper and bend the editors ear.
Instead of using this incident to "prove" that hams can be bad, too,
DO SOMETHING TO SOLVE THE PROBLEM.

<<2. The general atmosphere on the ham bands I've listened to is stuffy and boring.>>

Yes, normal conversations where one person takes a turn speaking while the other one listens. It must be incredibly boring for you.

<<3. I prefer to avoid having my name, address, and such posted where anyone with
a scanner and an internet connection can hear me on the air, write down my callsign, and look me up for whatever purposes they might have. It's easy enough to get info on people as it is.   I have no intention on making it any easier.>>

Anonymnity lets you avoid being accountable for your actions.

<<4. On CB the vast majority of people are friendly, helpful, and considerate. If someone thinks your radio sounds off or something they'll tell ya and will gladly offer any assistance they can to help get it right. The other night a dude that frequents 2 meters came down to CB and started telling people that their radios sounded strange. When I or one of the others asked what was strange about it (heck, if my stuff isn't working right I want to know what the deal is so I can either fix it myself or give a good description to the local tech if the repair is beyond my skill) he refused to say. He said he'd only help with such if we paid him $$$. What's up with that? After a little playing
around we determined that the problem wasn't in any of our radios, he was actually 4 kc's off frequency. I have an external freq counter so I know I am on freq, yet, to pull him in clearly we had to tune down 4kc's. We told him this and he left the channel. I guess he was shamed.>>>

I am curious, do these hams give call letters when they come on CB?

<<The point I'm trying to make is this. In this part of Alabama, most of the hams
are basically CB rejects. They didn't have the social skills to operate in a friendly manner so in an attempt to set themselves above those with whom they weren't able to interact with due to those weak social skills they went out and got a ham license. Now on the rare occaisions they show thier faces on CB they act like radio gods or something. Why would I want to hang with those people? I'm perfectly happy to talk to the people who are on CB. Even those who have king of the hill syndrome with the megawatt amps and such are basically good folks. I'll choose good folks to hang out with over assholes any day.>>>

Well, once a misfit, always a misfit, license or no. Here's a troubling trend I

see lately: a CB'er gets sick and tired of 11 meters (for whatever reasons) and
makes the effort to acquire a Tech license. But when faced with the study and code skills required to move to the next step, they lose steam and give up.

They
go back to 11 meters and/or become freebanders. Every once in a while they get
into an argument on the air and they attempt to bolster their opinions by
announcing that they are a licensed ham. Sad.

Anyhow, what's the point of your post? If you are comfortable on CB and it
works for
you then that's terrific. Nobody here is trying to force you to change or put
you down
because you choose CB. My remarks were addressed to one who felt that the FCC
needs to create a lawless version of ham radio on 11 meters.

Yes, that 1/2 wave thing might help with some impedance sensitive SWR meters,
and the MFJ 259b really makes life easy-- one of MFJ's better products. If I
had to make all SWR measurements at the antenna, I think I'd pick another
hobby.

I have to agree on this one. I owned the Galaxy Saturn Turbo Base, and it
never did even come close to my old Tempo 1, which I bought for $100. I also
bought a Yeseau FT-101 EE for $200, and it also performed better than any
Galaxy I ever owned.

The law empowering local law enforcement is listed in the FCC Code. Check the FCC Website, and search for it. It does exist, and I used it to shut down a base station in Rialto, Calif. Few people know this is possible. I will attempt to get you the regulation reference. I had to provide it to my local police in order to get their cooperation.

I think it is 65 feet, but only if the structure is erected for that purpose. The antenna can be 20ft above a structure is the purpose of the structure is not that of supporting an antenna. For example, if an apartment building were twelve stories high, and you wanted to mount the antenna on the roof, it could be legally 20 ft higher than the building.

I am surprised that this person, Dave, makes such a statement. It clearly shows his lack of respect for CB. I have met some of my best friends in life on the CB. I am a college graduate, and certainly not a baffoon. I no not hang with lowlife people. I have not found the world of CB Radio to be a place of "He-Haw" types. I clearly think you are wrong. I would say that the "Prophesies and expectations of the cynic are self fulfilling."

I need a 1 to 1, but I need it to fit into a 3 inch circle in order to mount it on a bracket. I will need 100 of them. It is a lot of work, and I was hoping to find someone with experience.

What size wire on the coffee can? I see in the Ham Radio Outlet catalog that they sell them, but they are too big and bulky.

I just had another thought about your situation. Wow two thoughts in 1 week :)

You have a 3' antenna mounted in close, parallel proximity to another 1.5'-2' piece of metal. The actual window frame could be absorbing a good deal of your signal and greatly attenuating it.

```
                          !
                          !
                          !
                          ! [
                          ! [
                          ! [
                          ! [
                          !=[
```

Hmmmm, looks like a J-Pole type antenna situation. I wonder exactly what this is doing to the effeciency of your antenna. The greatest amount of signal is radiated from the base of your antenna. Directly into your windshield frame.

I mounted all my antennas on the rear of my Wranger. (HF multiband) is on a 90 degree mount off the tailgate bolted with the center tire carrier bolt. 2M 5/8 whip is mounted with the same type 90 degree mount bolted to the right rear as high above the tail light assembly as practical. A friend of mine, an Army Staff Sargent, told me that the Army has a 4' rule for mounting antennas, they must e seperated by 4 feet horizontally. I am thinking about moving my HF antenna to the left side, but right now I am pretty happy with performance.

Take this with a grain of salt, as I am only theorizing in print... I would welcome any other comments.

OCT Tung! Jake Ventura got ran over on the Ventura highway & is NO hero.
He is one of you COMMIES because he echo's the 90's version of what yur
father lenin said about "religion is the opiate of the people." False state
church religion is, but not true religion, which is taking care of the
fatherless & orphans. True religion (Biblical Christianity) is the Power of
God. Are you what Krewschev said in that "WE will bury YOU ?"

Sounds like a bad ground or a short in the antenna.  I've always had to
replace my firesticks every seven years or sooner if they take a hard hit.

The HTX100 uses the same filter for SSB and CW. What is different is the offset of the carrier oscillator and LO, to place the signal at a different point in the passband. You could change the carrier oscillator offset to place the passband differently, but this would result in inaccurate dial readings because the LO offset is switched by the CPU. If you are having that much trouble, perhaps your CW carrier oscillator adjustment is misaligned. I've got the service manual at home; send me private mail if you need the alignment spec.

Well, a program to use your computer for a CB is news to me. You would most certainly have to have some kind of hardware to go with the program. This is simply because the computer alone does not have any of the necessary circuitry. Perhaps the person who told you this is mistaken, and referred a program that INTEGRATES a CB with your computer. That I have seen, and is pretty "neat" if you like to have "neat" things.

Stephen wrote in message <8105co$cl0$1@Usenet.Logical.NET>...

: :
: : That is a correct statement and it doesn't disagree with anything that
: : I have said.
: :
: : Power reflected from a load is, indeed, not necessarily lost.
: : Hoever, if this reflected power impinges upon a 50 ohm impedance
: : (the typical output impedance of a CB radio), it is dissipated and
```

: : lost as heat. The only way to salvage this reflected power is to
: : re-reflect it back to the antenna. This must be done by presenting
: : the reflected power with some other impedance (e.g. with an antenna
: : tuner or by retuning the transmitter output circuitry). The ideal
: : impedance where 100% re-reflection occurs is the complex conjugate
: : of the impedance seen looking into the radio end of the transmission
: : line.
:
: It IS in disagreement with what you said. Looking back into the
: transmitter from the coax - you have the conjugate impedance.

What are you talking about? This makes no sense.
If I connect a 50 ohm transmitter to a coax with an input impedance
of 38 +j20 ohms, the transmitter does not suddenly become 38 -j20 ohms;
it is still 50 ohms.

You've chosen a good example to demonstrate what is wrong with your analysis.
The reality is that there is no difference whether you are transmitting
pulses or steady state. The oversimplified "lumped element" model breaks
down when you are not transmitting steady state. That is because it is
an analytical approximation that is only accurate enough to study steady
state analysis.
A "distributed element" analysis (which is accurate under all conditions)
considers the power flow through elements. And it demonstrates that power
(pulsed or steady state) does indeed flow back into the transmitter as

I have said.
Do you really think that power somehow travels differently depending upon
whether or not it is pulsed? If I shine a flashlight at a mirror, does
pulsing (blinking) the light make more light power get to the mirror? Does
leaving the lamp turned on make less light emit from the bulb (by operating
"less efficiently")? Of course not.

> We will have to "agree to disagree" about power getting back into the

I'd like to see a reference that contradicts this. I'll rip it apart
(figuratively).

Well I have found a program to download on the internet that was sappose to let you. But it didnt work. Acording to the people I talked to they had it themselves. I did pick up my uncle across the road on my computer. He has a 150 watt amp thing hooked to his cb though if maybe that had anything to do with it. Sorry not good with the technicle terms yet. Just getting my first cb in a couple of weeks, so I'm a newby at this.

Selling to help settle a family estate

There is one tube driven CB, It's made by Johnson, it says "Messenger"
on
the front and there is a casting of a Viking, so I presume it's a Viking

Messenger. The model # is 242-128. Chrome front. From what I found out
this is what they called a "White Face"

There is one tube missing, as well as 8 of the 10 crystals. However, if
you
can dig up a schematic or tube diagram and let me know what the tubes
and
crystals are, I probably have them here (tons of crystals and tubes from

this estate)

The other CB is a Midland. Model #77-155. Looks like your run of the
mill
radio, transistor. No mike attached to it, but it's a four pin
connection.

I also have a very old Marconi/Raytheon Models 1583D and 1585B, two
pieces
of a set. This is a mobile radio, tube driven at 6 volts. Freq. 162-172

Mhz. It has some parts missing, Like crystals, but nothing of the
circuitry. 30 watts output. Has a very old hand held mic attached to it.
Looks like something that Andy Griffith would use :-)

email me with your offers or questions

William

Greetings!

No, what I heard what he was praying to Allah, then decided to ask for "local info on the Atlantic", or a 10-36 on channel 19, which killed the autopilot. There was a Cobra 19+ on board, and was still pinging due to the RF-limited Echo Power Mike with RB stuck on, which confused the ROV.

Fortunately, it didn't have airbags. You just never know these days.

What happened to the engines was when the reply was "you gotta speak a little louder into the mike.", he turned on a SkyWave Amp and the darn turbines dogged down so much they flamed out due to the torque placed on them by Leece-Nevilles used to keep the battery voltage up.

Some "aftermarket" upgrades should never, ever be tried, without checking your warranty.

Put the Alternator mod on one engine, not both.

We'll see what the NATSB has to say, after the FBI and FCC look it all over...

While Dancing with the Mouse on 18 Nov 1999 00:56:06 GMT, the Modem interrupted with an MNI from "rhooligan2@aol.com (RHOOLIGAN2)", and the MotherBoard buffered this to Video RAM:

:+> <<yeh knucklehead but where are they when they do it, they are just a tad up
:+> high usually unless you are flying egyptian air lines,...............can you
:+> smell what icm is cookin,.............icm out.....>>
:+>
:+> Uh huh. Rumor is that Egyptian Airlines flight's onboard computer got locked up
:+> by 10 KW of RF from channel six.

Regards!

```

Greetings!

Whats the match on the roof of the car?

[Thats really the best spot to put it.]

Then if the match is lower on the roof, the trunk section needs to be looked into and figure out what is causing the mis-match there.

A lot of times, it's the wires for a rear-window de-foger/icer or the rear pillars used to support the roof.

Even a poor ground return - which can be verified by measuring resistance from the trunk lid to latch assembly for that lid.

> A small difference from ohmic measurements from battery ground to trunk lid [a difference of .2 ohms or higher when compared from frame to battery ground] leaves you a lot of room for RF problems.
>
> A Trunk lid is bolted to the frame, versus the seamless pillars that are welded/soldered onto the lower main frame and finish metal.

Forget the roof if you have a soft-top or tonneau cover...sigh...

While Dancing with the Mouse on Wed, 17 Nov 1999 14:16:53 -0700, the Modem interrupted with an MNI from "T.H.E.CAT@surfside.edu (T.H.E. CAT)", and the MotherBoard buffered this to Video RAM:

```

Will the structure hurt signal? Ideas will help.

No, but the lowered height will. The bottom of
the antenna (feedpoint) should be at least 37
feet above ground (1 wavelength at 27 mhz) for
optimum performance

Jack

Are you refering to Microsoft Netmeeting? This software may already be on
your computer, it was included with Windows 95 & 98. It allows you to
communicate with other computer owners via a public server using your
computer sound card and microphone. It also supports a video link if you
have a camera set up. Not exactly CB, but you can converse with about any
country on Earth, language being the only barrier, try it, it can be fun!!

Make sure all the coax connectors are tight. The jumper your using with
the meter might be bad, or it could be the meter itself. I had a an 11
year old Archer SWR meter that I recently replaced. It was doing the
same thing yours is.

Greetings!

[Disclaimer, I don't readilly know your setup, type of vehicle, and other particulars that are described, but I need to know some other things that hopefully this message will help outline for you to take a look into and try...]

Well, lets' take a look at the issues one at a time below...

While Dancing with the Mouse on Wed, 17 Nov 1999 15:34:02 -0700, the Modem interrupted with an MNI from "Kevin Brady <kbrady@rsinc.com>", and the MotherBoard buffered this to Video RAM:

:+> Got an odd problem with my CB antenna. I was out 'wheeling with some
:+> friends, and on the way home we were listening to the truckers on
:+> channel 19. There were numerous times where my buddies could hear
:+> truckers that I couldn't hear well or at all. Their signal would break
:+> up. They could hear me broadcasting fine, but I often couldn't hear them
:+>
:+> very well.

Hmm...faulty mount? I think I'll need to take a look at that picture.

Lot's of times, and I just recently got some flammbe'd stuff regarding this...

The Coax? What are you up against?

Lot's of times, the pillar mount types like the one you seem to describe, work fine and always will show a good SWR, with one small problem.

The vehicle is not providing the best ground there. You are experiencing what I've got flames over before. Poor ground connections where the working element, the antenna, is not really working the vehicles ground. Instead, it's using the coax.

Coax, shielded inside a car, or any vehicle, makes a poor antenna. When your antenna mount decides not to ground at the antennas location, the coax acts like the antennas other element, or what the vehicle should have been, but isn't. Receive cuts in and out.

Although this may be another topic, where and how is the radio mounted?

There's a lot of variables...

One, proximity of your receiver to the other truckers, or other traffic on another channel could knock out your receive while others travelling along with you, can hear other on the channel just fine. It's not a fault of the antenna, it a characteristic of the radio, trying to hear only the channel you're on, not the other channel. The radios attempting to reject the other channels signal, while trying to sort out yours.

When using a "mickey-mouse" [sorry, it's the best way I can put it] type of mount, where holes are not drilled and it requires compression, like a trunk lid or rain gutter thru the use of set-screws, they don't work 100% of the time due to paint being an insulator and rust ruining the connection.

Having your radio mounted to metal helps take care of that. A poor connection can occur at the antenna. The radio will use the ground of the vehicle if you mount the metal case to the vehicles own ground - the coax then has the same shielding potential at the mount and at the radios, even if the connection to ground at the antenna is poor.

The bracket offers the most convenient means. Plastic is a poor conductor. So, metal to metal is the best.

:+> We decided it was my antenna, so I did some experimenting at home. I
:+> turned on a NOAA weather channel to get a constant signal, and after
:+> some testing found that if I touched the antenna mount just below the
:+> antenna, I got good clean reception. When I wasn't touching the antenna
:+> mount the signal was scratchy and not very good.
:+>
:+> The question here is this: When I touch the mount am I grounding the
:+> antenna, making it better, or am I a better antenna than my antenna?

You're better than the antenna, at picking up WX frequencies. The antenna, if it doesn't say it's tuned for WX-band reception [it'll say it on the package] you take chances. WX-band is in the VHF section, you're in the HF section of the band. Most WX-band compatible top-loaded antennas will have a separate close wind about 12" above where the mast meets the ferrule for the mount. You can see it in the shrink-wrap of the protective outer sleeve.

Antennas for CB that are 3 feet or shorter, can't tune to WX-band very well. You'll need a longer antenna for that purpose. You can get by with what you have, but it's also the reason why you're out here too...

:+> I've got a Midland 77-115 "WeatherMax III" CB with a Firestik II 3'
:+> antenna mounted to the driver's side windshield frame. The antenna was
:+> tuned at the shop I bought it at and they said I was getting an SWR of
:+> 1.4. I can send a pic of the antenna mount if anyone's interested.

I have a Midland 77-115, and I can attest to the fact that it *does* require the use of antennas that have WX-capability. Otherwise you don't have the best reception in fringe areas.

Greetings!

Sounds like bad coax connections, or you have an SWR meter with Field Strength, or F/S. Don't touch the F/S metal knob where the sensing antenna goes to. This can give you your "funky SWR" problem.

If putting your hand on the meter, makes the SWR go up or down, you have a poor coax connection somewhere.

If you can, pound a stake into the ground where you place the bucket. This way, a ground strap can be fashioned and connected to the A99 at the location, helping to keep the coax from becoming part of the antenna. The rod stays in the ground, and pound it flush to earth so you can mow over it, and neighbors don't see it.

While Dancing with the Mouse on Wed, 17 Nov 1999 15:43:14 -0800, the Modem interrupted with an MNI from "Adam <adam26@nol.net>", and the MotherBoard buffered this to Video RAM:

:+> I seem to be having trouble with the SWR on my A99. When I set the meter
:+> to Calibrate, the needle fluctuates and I can't get a decent reading to
:+> set the SWR. My neighborhood does not allow antenns, so here is what I
:+> have to do with it to set it up under the cover of darkness. I have the
:+> A99 bolted to some long closet poles, which are stuck in a piece of PVC
:+> pipe that is cemented in concrete in a 5 gallon bucket. This allows me
:+> to put the antenna up and take it down in a matter of minutes.
:+>
:+> Why does the needle fluctuate when I try to calibrate it? Does the
:+> antenna need to be grounded to something metal or what?

Greetings!

Try using a mag mount antenna base, with a simple "stubby" antenna, like a scanner antenna, it'll still pick up signals, only a lot weaker in your favor.

Place the mag-mount on the rear-portion of the tailgate, trunk lid or hatch.

Connect the coax to the radio, set your RF gain all the way up. Look at the meter, and turn down the RF gain to 1/2 scale if he's full scale, or at least 1/2 scale on the RF/S-meter of the radio.

In a parking lot, drive in a circle and watch the meter. It'll rise only in the direction the vehicles nose is pointed to. Thats the direction to take.

Then go in that direction. Until the meter is full scale, then reduce again, find a parking lot and repeat above.

This can get you to within 100 yards by simply using a de-tuned antenna and the location of the antenna on the vehicle by repeating the steps above. This gets harder as the signal rises, you can then simply remove the antenna from the mount and use the metal mount, or ferrule, as an even less sensitive antenna. This can get you pretty much to within 3 houses, or within sight of the antenna, of the offender.

A cheap way of doing it.

RDF'ing an offender is not easy all the time.

While Dancing with the Mouse on Wed, 17 Nov 1999 23:50:18 GMT, the Modem interrupted with an MNI from "DogCatcher@ThePound.Net (Charley)", and the MotherBoard buffered this to Video RAM:

:+> Could anyone tell me what to use as a radio direction finder
:+> or where to look on the web for more information for catching
:+> a CB jammer base station? All I've found in the way of
:+> RDFs are for 130 MHZ and higher. Need something for 27

Greetings!

Oh geez, lets not get Mr. Ohm rolling over in his grave again...

10KW Jesus is correct, in the fact that if you're happy with what you have, then don't let anyone else interfere.

You're making things too complex.

Break this down Bob.

If the antenna is resonate, or provides a 50 ohm impedance using coax of 18'. We'll see an SWR of 1:1. Because the antenna is tuned to make resonance at 18' of coax.

You'll find out that it's not the vehicle that makes a good antenna. The counterpoise it provides at different locations, is far from ideal to allow the antenna to be resonate without the *manufactuers required* length of coax to provide for it. Something else is occuring and I beleive we agree on this.

If the ground/counterpoise can offer this same level of resoance the antenna is working against, the coax should be able to decouple itself and remain a feedline to the feedpoint.

If it's not ideal, we no longer have a feedline, we have an antenna with all this coax, and the feedpoint is actually the part [PL259] connecting to the radio.

Don't blame the antenna, the coax, the SWR meter, or the Radio. It's the operators fault that they can't set up the antenna where *it* wants to be. Or should that read, where *you* want it to be[?].

Blame the CB'er, then get on with your life.

We're already accepting the faults regarding antenna placement.

We can live with it.

Millions of us have, are now, and always will.

While Dancing with the Mouse on Thu, 18 Nov 1999 02:05:27 GMT, the Modem interrupted with an MNI from "MC 10kW Jesus <qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

To all of you who responded to my inquiries about the Wilson 1000, thanks bunches for the responses and suggestions. I will try them out and share my conclusions/solutions with the group.

Even at 1.5.1 it still kicks a**. The other thing I noticed immediately about this antenna is how much better it "hears". The difference is astounding. And my three ft. Firefly was flat all the way across!

I'm sure everyone in this group has their own "favorite" brand of antenna they swear by, but anyone looking for a mobile mag mount antenna, the Wilson is a great product. I will miss my 3 ft. Firestik, but it's just seen better days (lotsa use, lotsa road miles).

Thanks again,

--

Hello All,
I am looking for a radio that was called JFK. If anyone has one for sale or know where I can obtain one, pleasr reply back to me at hwroger@interkan.net. Please include the price you are asking for it.
Thanks
Roger Harris

Well, well, well....

Just received my HTX-10 Service Manual. It's finally off backorder.

Unfortunately the index indicates that the schematic is on page 54 - there is no schematic, and page 53 is the last printed page before the rear cover. Another copy of the instruction manual was attached. All this for $20 some bucks... ya-hee. Rushed out the door, perhaps, given its backorder status, dunno...

[Dunno if this was just a mistake on my manual only, or if this was a printing problem, or if the packager just forgot to grab the schematic and put it along with the service manual - conceivably it could have been a separate 2-page foldout item, not bound into the book. Got in touch w/Tandy and "they're looking into it". My local RS store manager said if that didn't do it, he'd help rattle some cages; he understands why schematics are important to hams and that many of us are not "consumer product" people.]

Nevertheless, it does lay out PLL calibration, give comprehensive alignment steps & test trees, etc.

Prob. much of this manual has been somewhat "boilerplated" from the TRC-485 CB manual - for example, a voltage chart for most all the transistor E/B/C or D/G/S measurement points includes introductory standard conditions, including the text "Measurement channel: CH 19". I'm hoping these test values are correct, as the TRC485 seems to use an older & somewhat different board than the HTX10. English text is

OK but with a bit of an abrupt style.

A Very Preliminary Quick Look

(warning: prob. an error or two here... just what I can
quickly infer from a convoluted blk diagram)

Looking at the blowup pics of the CPU board I see no sign of jumpers, 0-ohm "resistors", or friendly areas where diode matrices offer "configurability".

The PLL synth + CPU + display controller LC72322 runs off of a 4.5MHz xtal clock. This clock xtal is "pulled" by the clarifier control in conjunction w/a varactor. (This is OK since CPU doesn't perform any ultra precise timekeeping duties and is primarily only for PLL frequency control & assoc. dial & display functions.)

This 4.5MHz oscillator does not appear to feed anywhere else other than the PLL/CPU chip. The dividers (or early "swallow counter" stages thereof) on this PLL are fast so no offset mixer is needed. (The 72322 apparently will run a PLL at up to 150MHz.)

The FM modulator is not apparent from the block diagram; I'd bet they just apply some filtered & preemphasized mic audio, when in FM mode, to the varactor on this 4.5MHz reference.

NOTE: the 10.24MHz is 2nd AM/FM LO is *ONLY* (at least from the blk diagram). Even though 10.24MHz is a "friendly" number for PLL CBs it's not really useful for the HTX-10's 1KHz PLL steps.

The 10.6975MHz "carrier osc" xtal is "pull-tuned" by LC circuits for the 3 modes - 10.6975 is for USB mode, 10.695MHz for AM, 10.6925 for LSB.

But according to the diagram, it doesn't seem to need this osc. for AM/FM receive as SSB and AM/FM have 2 separate receive signal paths. In AM or FM, the VCO mixes sig down to a 10.695MHz 1st AM/FM IF, w/no gain stage. Then, a 10.24MHz 2nd L0 mixes 1st IF down to 455kHz 2nd AM/FM IF, where there are 2 gain stages before AM or FM detectors.

For SSB receive, it appears that after 1st conversion mix w/VCO, a 10.695MHz resultant SSB IF signal runs thru xtal filter & *four* gain stages) before a 10.695MHz (+/- 2.5kHz offset for USB/LSB) is injected into product detector to bring it down to audio. (Is this mixing operation "demodulation" or also a "conversion": that is, can we still call this double conversion? Hmmmm.)

From the above numbers, you can kinda infer the transmit path. A 10.695MHz (AM; +/- 2.5kHz for LSB/USB) carrier oscillator is run, in SSB modes, thru a balanced mixer; no mod is run thru the bal. mix in AM mode. This bal. mixer output sig is mixed w/ a VCO signal up to 28.xxx MHz. In AM mode, a 3 stage transistor modulator feeds the driver & final amp. (No, they didn't turn around the audio amp IC in transmit like lots of older CBs.)

But given the above, with the standardized filters/tuned ckts set up for those IF freqs, and with no "mixer offset oscillator", it looks like one really can't change xtals to move freqs; the PLL divider number must be changed.... and that's only software accessible. Adding mixer/buffer/offset ckts in both T and R would be the only way to "pull" this radio - or to replace the PLL control unit...

More when I know more (and/or correct mistakes above...)

Yeah I have netmeeting and use it. When I heard my uncle across the road talking to his friend on the cb. I also could talk to them. I had to turn the speakers up loud to hear them but it worked. I also pick up a faint sound of a am radio staion here. I have to crank the speakers to barely hear it but i can. IT was kind of weird when i talked to my uncle on here. I just talked through my mic. I asked if he could hear me and he said yes. Then shortly after I lost the connection.... He is like right across the street from me. He uses a amature ham radio cb. Dont know if thats how to explain

it. It's a cb with ham stations. He has a 150 watt amp on it. When he uses
it his car cb keys up. Even when it is not on. We live sorta in the
mountains so were up pretty high. Would that have anything to do with it?

Check in the Ham publications. There are programs that allow you to use the computer to act as a broadband receiver. There maybe some other devices to buy as well.

Mag mount antennas can be tricky.  Is the case of the radio grounded?  If it is
mounted in plastic, you have an unusual ground problem.

Keep your second hand away from the SWR Meter as you read it, and watch for a
signal strength antenna socket.  Sometimes your had near such a socket will
induce an artifact.

Was the 3 ft Firestick mounted on the same trunk? If not, check to see that
the trunk is grounded with the rest of the body.

How about a PC-based CB radio? Shortwave has the RX-320, Scanner has
Winradio and the PCR 100/1000, Ham radio has the Pegasus.
(by the way, any reviews on this transceiver?)

The DDF-1 in the Ramsey catalog IS a doppler and works great but only works down to about 100MHZ.I built thier unit and was especially impresed with the digital filter.If you try one of these Ramsey has a mistake on the switcher board causing the array to spin backward.The easiest way to fix this is to reverse pins 2 and 4 at the DB9 connecter.I told Ramsey about this but they didn't seem too exited.

No CB made will do this and using a pair wont work as the transmittert
of one will get into the reciever of another.Besides people on this
group are whining about not having enough channels so don't take up 2
for one qso.
I like the idea that the other station has to wait for me to

finish,too bad telephones don't work that way.

Tim,

Let Dwight live in his happy little radio shack world where everything goes according to Gordon's Ham-Made-Easy $19.95 books.
You know, I know, and everyone out here weather they have their ticket from Uncle Charlie or not knows different. If we all just filter his little pompus ass, he'll be alone with his ego and maybe he'll crawl back under this pile of cow dung.

>
> Do you really think that power somehow travels differently depending upon whether or not it is pulsed? If I shine a flashlight at a mirror, does pulsing (blinking) the light make more light power get to the mirror? Does leaving the lamp turned on make less light emit from the bulb (by operating "less efficiently")? Of course not.

Let me expound on this. And let me define a few terms first.
Lumped elements are common circuit components (like resistors, capacitors, and inductors) that are much smaller than a wavelength and can be analyzed in a circuit with little regard to how electromagnetic waves propagate along them.

Distrubuted elements are circuit components where length and time is a definite factor in circuit analysis (best example is a transmission line).

Lumped element analysis is the simplest and easiest. There is little need to worry about where and how the power is flowing.
For steady state analyis, even distributed elements can generally be treated as lumped elements. This reduces the complexity of the analysis.

The highly revered Smith Chart is a "lumped element" analysis. That is, it describes a circuit merely in terms of impedances that could be created with equivalent lumped elements like resistors and capacitors (or inductors). It does not attempt to describe power flow. For most applications (which are steady stae) it does not have to. For steady state analysis, it is an accurate model.

But, when you leave the steady state (when you start transmitting pulses), the model breaks down. What you get are not the impedances seen on the Smith chart. A little more complex analysis is required. It becomes a control theory analysis requiring a look at the power flow and the characterisitic impedances.

Does power flow differently when it is pulsed than when it is in steady state? Absolutely not! The lumped element analysis is a simplified analysis that is 100% accurate in many cases but not all. You have to understand its limitation. The distributed element analysis is accurate in all cases (steady state, pulsed, whatever you got).

Now back to the original question:
Does a transmitter transmitting into a mismatch merely "operate less efficiently" or does the power actally flow out, then back in to be

ultimately dissipated by it?

If you perform a lumped element analysis, you can find an equivalent impedance for the input to your coax, substitute it into your circuit for analysis and find that it appears that the circuit is merely operating inefficiently and no power goes out or comes in.
(This is what you are doing).

But we know that isn't true because it can be shown with a power meter that there is a lot of power out there going up and down the coax.

Furthermore, if you leave the steady state and start transmittion pulses, your analysis goes all to hell and your predicted results do not agree with your imperical results.

But, if you use a distributed analysis, you find that power does indeed go up the transmission line and back to be absorbed by the transmitter. And, steady state or not, this analysis agrees with the results.

Bottom line: For a 50 ohm transmitter, reflected power does flow into the transmitter where it is dissipated as heat.

Technically, that is not true. While there are 3 "elements" they are not
aranged in a typical yagi fashion, and do not provide the same
advantages. The driven "element" changes, with the antenna switch, and
the remaining 2 become parasitic reflectors, making it roughly
equivilent in performance to a 2 element beam, which explains the
pitiful gain numbers.

At least we know beter than to tune SWR by cutting coax.......

or that a Cobra 29 will NOT put out 50 watts of power, no matter what
"bubba's" CB shop claims.

or that running enough power can "make" DX conditions.

or any of the popular CB technobabble myths.

Yes, it does.

> If this was the case then you should be able to connect

> see a 1:1 match. They won't see this at all,

Well, actually, they do. You just can't measure it.
All power from transmitter #1 goes into transmitter #2; and all power
from transmitter #2 goes into transmitter #1.
No power is reflected. The power coming back is the transmitter
power from the other radio.

> and i know that you
> would never do such a foolish thing, because you know they wouldn't

The transmitted signals *do* see 50 ohms. The problem is you
have power coming back from the other transmitter. It is impossible
to separate the measurement of the reflected power from the measurement
of the other transmitter's forward power.

You know it. That was a good hypothetical situation. I'll leave
the experiment up to you.

I very recently purchased an Eagle Sidewinder 400 10 Meter radio from Coppers Electronics. The radio was in perfect asthetic and working condition, but of course needed to be converted for channels. The modification for this unit is all over the internet and i had no problem finding it, but, what i was not aware of until i received the radio and opened it up to convert it, was that Eagle has changed the circuits in the radio to make it harder to modify for frequency expansion. So, i ordered the Tip & Tricks video # 9 tape that has different types of modifications for the Sidewinder, all the while wondering if the tape, shot 2 years ago, had been updated to reflect these circuit changes made to the radio, but assuming that no tech, except a crooked one, would continue to market a modification video for a specific radio that was no longer accurate because it was outdated.

Well...the Tips & tricks video tape #9 from Coppers Electronics is outdated. And, if you purchase it to get the 400 channel frequency conversion information you will have wasted your money, and will have been ripped off. All the other information on this tape is still valid, but the 11 meter channel conversion information as presented, is impossible to effect because the circuits that the video instructs you to alter are no longer there. So, do not buy the video for channel expansion until they update it and make it current, or you will be THROWING YOUR MONEY AWAY! They have even put a picture of the new radio on the video box, (has no Ch9 print on the upper level center button on the front panel), old ones did, to make you assume that it features the channel mods for that radio. IT DOES NOT!!! Only for the old one...period. That they put in an effort to change the photo on the video box from the old radio to the new one, proving that they realise that the radio has been changed, but did not update the channel expansion information accordingly, seems to point to a willful intent to defraud. You decide, but it seems that way to me.

This is not a complaint about Coppers service or products in general, i have had really good service from them. But, only that this tape has not been kept current to reflect changes made the unit concerned.

I figured out the new channel modification procedure, and made this change to my radio last night, and i could not be more pleased with the results. I now have 400 channels, 5 kc's up or down for each one, USB, LSB and FM. For the money, this is the best 10 meter unit i have seen.

As we all know, money is hard to come by, and i would feel really bad if i thought more people were getting ripped off on this video like i was, only because i did not speak up.

I think you meant DSB, but that's a whole different animal. There are some HF stations that use DSB - which sends both sidebands but no carrier. That is something that is REALLY strange to listen, because it sounds pretty much the same regardless of whether you listen to it with your receiver in USB, LSB, or AM mode. There are a couple of HF "numbers" stations that use DSB frequently. One of them is known to come up on 8992.0 occasionally, which is how I first discovered it (the station, not the mode).

For the most part, I agree. The only exception I can think of for SSB is the phenomenon known as polar flutter, something I've observed on HF from time to time - in fact just last night I was getting polar flutter on a signal from Thule AB in Greenland on 8992.0 while Thule was running a phone patch to Lajes AB in the Azores for one of the USAF aircraft involved in studying the effects of the Leonids meteor showers. The aircraft (AGAR 35, probably a modified EC-135 belonging to the 452 TW at Edwards AFB) was over Madrid at the time...none of the participants had any trouble hearing and understanding each other,

but I did notice some polar flutter on Thule's signal, as did another
SWL in Texas with whom I was talking over IRC at the time.

Thule's signal was plenty strong enough, so the polar flutter did not
affect intelligibility, but I suspect that at weak signal levels they
would have been rendered unreadable here. However, I don't think
that's going to happen very often with an EME signal.

73 and good DX'ing,

If I may expand on the impedance ratios a little as this is an area of great confusion.....:->

A balun is a transformer. That's probably why they are called "balun transformers". Just like any transformer there is a voltage ratio. This is equal to the turns ratio of the transformer. So, if you had 1 turn going in (primary) and 1 turn coming out (secondary), the voltage ratio would be 1:1 If you added another turn to the secondary the voltage ratio would be 1:2. However, the impedance ratio is the square of the windings so it would be = 1^2 : 2^2, or 1:4, usually referred to as "Four to One". This is ultra-important if you are experimenting with these devils. You'd be amazed at how much power you can safely pump through a very small toroidal balun.

Dave, how could you fail to mention spraying your antenna with Teflon?
How COULD you POSSIBLY forget that? :-)

Joshua, the short answer is no. The long answer is that it is technically possible. There are devices made called duplexers that allow you to transmit and receive on one antenna simultaneously. However, because CB channel frequencies are all very close together, the size and cost of this duplexer would far exceed the value of even the very best CB radio. In fact, the size of this duplexer would be about the same as a big refridgerator.

Mc

I've found that once you get out in the rural areas there are no CBers, period. In
the big city there are a lot of spotty-faced kids with too much time on their
hands
- and probably too much of something else on them too..

He won't post because he can't. What he claims is pure hogwash. I followed the situation very closely and wrote several articles regarding this. As of present, Kingston, NY stands alone in their perserverance of flagrant radio violators. Kingston passed an ORDINANCE(not federal law)locally that allows them to persue what they deem "problematic". This may be what he is referring to. Lots of talk though, coming from the Hill(Capitol) about enacting some sort of nationwide allowances to local authorities.

That would be theft, and not a crime against the state.

Crimes against the state are (usually) to get a certain freedom, and usually do gain constitutional amendments....

Crimes against the person don't.

Big difference.

Toll Free

if its getting warm you need a combiner which is  capable of handling more
power.  Who uses enamled wire?  tx star? rf parts?

2 combiners in the 4 pill and up, input and output, just a different # of
ports. Which each combiner would have the same attenuation regardless of
the # of ports.

> They are a <<bit>> lossy, but do work.

How would you tie multiple stages togther any more efficently without them?

Well Dwight, go back and read my first post on this topic. Yes, I have over a hundred countries. Yes, I did the majority of contacts on the freeband. All contacts were made between 25 and 27.995. Most times it was 12 watts out on the sideband. This is not a miracle or even really all that hard when the conditions are on. I seem a bit perplexed as to how, and why, a licensed ham can not perceive this or come to a realization that many folks have over a hundred countries in their logs running nothing but legal power. It just isn't that big of deal. Sure, it takes patience and lots of radio time, but....you are still wrong.

Maybe you should call Copper's and tell them about the inaccuracies in the
video... Maybe they didn't know the PC board was changed in the Eagle
Sidewinder 400...
That might save a lot of headaches for potential buyers in the future...

>I very recently purchased an Eagle Sidewinder 400 10 Meter radio from
>Coppers Electronics. The radio was in perfect asthetic and working

>Spiker

What you mst likey experienced was his illegal amplifier bleeding over
onto your computer's speakers. The radio simply overloaded your
amplieier in your speakers. It is common for illegally amplified CB
radios to interfere with consumer electronics. In rare cases, also,
perfectly legal radio setups can do this, due to poor filtering in many

audio/video products out today. CB amplifiers, being illegal, obviously have no technical standsrds for quality control. As such, many of them are rather dirty. Also, many CB operators modify their radios, which cause this "bleedover effect" due to cranking their radios beyond design limits. Couple this dirty radio with an amplifier and you really have problems.

Funny, I didnt see any mention of Amateur Radio. You remember Amateur
Radio, don't you, John? Lots of CW still there. Give a listen sometime
in the ARS CW bands, you just might hear some. Unless of course you
prefer to listen to encrypted RTTY signals. Oh, and last time I checked, my
knuckles weren't dragging on the ground. You must have mistaken this CW op
with someone else when you made that general statement. Oh, and good
DXing./SWLing.

I keep getting on the bowl and calling you. I see from another post that you were not on the air at the time I call you. I heard somebody say something about big apple trees about 6 PM EST today (thursday). I would have stayed and tried to talk longer, but Bad Whiskey was in the 'hood doing his thing, so I went to 11 and made some contacts. I also seem to do good on 26.

Hey folks, Listen me Friday. Will be leaving the office sometime between 6 PM and 7 PM.

I'll try 6, 11 and 26. (Well not 6 if one of the big locals is taking over again :)

Here is an auction for a 4CM400,000 pull from the Voice of America.

Current bidding is at a hundred bucks... But it has not reached the reserve...

Should be good for nearly 1.2 megawatts!

Read, and enjoy.

me again! Just reading through some postings and realized--- i don't have a clue what any of this is. So if you did want to take the time to answer me REMEMBER I don't know nutten! So speak to me as if you were explaining it to a 4 year old.

Again Thanks

This is a bullshit mod and it drives me bananas every time I see it posted. The values of the resistors are chosen as part of the band-shaping modulation circuit. changing them to lower values will give you a little more gain on the mic preamp but the reality is this radio, and the GrantXL, have enough gain already. If you remove the transistor the radio has no way of regulating the output on SSB. It will simply run open-loop. Anyone with a smattering of ignorance in amplifier design knows that turfing the NFB will add distortion.

> MODULATION: Remove R131
> AM POWER: VR10
> SSB POWER: VR11

If you remove TR24 above, removing R131 will have no effect on the radio.

On 2 meters, their is actually a positively endless roger beep. That is not controllable by the user, just the ower. But, human beings are gonna be human beings, and I've heard just as many confrontations on ham as I've heard on CB. Sometimes on CB, it seems to be the norm with a group of people. That is, these people get on there an bitch to each other but the funny thing is, they all seem to know what is going on and they seem to enjoy it. On ham, when you hear people bitching, you know thier is a definate confrontation going on.

Ahh, but get this, if you have two radios with locked Tx/Rx tuners,
then if one of the radios is just slight off, guess what, they will
never be able to be tuned to each other!

Thats why radios built with seperate Tx/Rx, that is a locked Tx and
a clarifier for the Rx. The reason for this is that not only are
different manudactures going to be off, but temperature fluctuations
cause frequency drift, and this is somewhat impossible to overcome.

In mym area, you can't just turn on the CB, listen for a few minutes
and say, "well that sounds like nonsense, I never wanna listen again."
If you consistantly check the band, you'll sooner or later make a good
qso and it will be enjoyable.

To may people buy a cb, turn it on and think that what they
immediately hear is exactly how CB is, and this isn't true.

If you had actually seen a set of these radials, you'd know that they
are fiberglass and have wound wire around them, so they are actually
much longer than 6 feet.

> transformers".

The term "balun" is a derivitive of the words "BALanced to UNbalanced".
It is used to matched an unbalanced feedline such as coax to a balanced
antenna such as a dipole.

Selling to help settle a family estate

There is one tube driven CB, It's made by Johnson, it says "Messenger"
on
the front and there is a casting of a Viking, so I presume it's a Viking

Messenger. The model # is 242-128. Chrome front. From what I found out
this is what they called a "White Face"

There is one tube missing, as well as 8 of the 10 crystals. However, if
you
can dig up a schematic or tube diagram and let me know what the tubes
and
crystals are, I probably have them here (tons of crystals and tubes from

this estate) This unit has been sold

The other CB is a Midland. Model #77-155. Looks like your run of the
mill
radio, transistor. No mike attached to it, but it's a four pin
connection.

I also have a very old Marconi/Raytheon Models 1583D and 1585B, two
pieces
of a set. This is a mobile radio, tube driven at 6 volts. Freq. 162-172

Mhz. It has some parts missing, Like crystals, but nothing of the
circuitry. 30 watts output. Has a very old hand held mic attached to it.
Looks like something that Andy Griffith would use :-)

email me with your offers or questions

William

Something doesn't sound right here. If you have 1.5:1 on channel 1, you are saying that you also have 1.5:1 on channel 20 and channel 40? I don't think this can be. You should see a slightly higher or lower SWR between channel 1 and 40. Depending on this difference, you can make the choice of pulling the antenna up a little or cutting the whip by a few millimeters.

Get some coax and peel back 18 feet of shielding from around the
center conductor. Then, stick it up in a tree next to your room.
Drape the other end with the PL259 into your window and connect it to
your CB. Viola, you now have a halfwave dipole.

I was wondering the same thing. It doesn't seem like anyone on this
newsgroup uses one. If you go to their website they claim they have
the best receiver on the market. I don't know about their
transmitter. Their website is: http://www.texas-ranger.com/

mount a firestick antenna above the roof. I have had good luck doing this. I

used a magnet mount stuck to some metal on the back of the roof. I had no
problems doing that.

I think you mean peel back 9 feet (ie) 9 feet of center conductor as half of
the antenna and the shielding makes up the other 9 feet for a total of 18 feet
with the feed at the middle.

Or you could take a 2 foot 2x4 and nail it to the eav right at the peak of the
roof.
Then take a 9 foot copper pipe drill two holes about 4 inches apart on the lower
end.
Use screws to mount the pipe to the 2x4 and hook the center conductor to the
base of the pipe.
and use 4 wires cut 9 feet long for the radials at set at every 90 degrees hooked

to the
shielding.

you don't want to put 1kw in to it because it probably would set the 2x4 ablaze
but it is perfectly fine at 4 watts

And you can use a 4 or 5 foot 2x4 if you want to elevate the feed point a bit

Do you give your doctor a hard time for knowing
something about medicine when you go in for a check-up?
Would you rather he just come up with his own ideas
on how the human body works?

Get out of your mind, cause it's much too small.

Bob.

Is anyone interested in buying a COMPLETE Siltronix / Swan station? I have a
Siltronix 1011-D (26.935-27.865 10 meters removed) and a Swan 1200-X
amplifier, a FD-1011 freq. counter, Siltronix SP-1011 external speaker, Swan
CM-17L (Shure 444) microphone, Swan WM-3000 (0-2000) watt meter, and ONE
extra 8950 power tube. MOST gear is 7/10 . The radio needs the new tube. I
have owned the radio for 20 years, and am the original owner. This set-up
will DX damn-near anywhere! If you can hear 'em, you can 'work em.' If NO
ONE is interested, I will eBay it. I am asking $500.00 firm. Surf the web...
check-out the prices. This is a VERY good deal. A COMPLETE station. Oh ya,
the amp does 350-400 watts P.E.P. on sideband. SERIOUS INQUIRES ONLY !!!!
No SPAM, NO FLAMING, and NO B.S.

Here's the dicrepencies:
 1. Siltronix 1011-D needs new POWER tube. I'll give you ONE.
 2.Swan amp: ONE scratch on face(barely noticable)
 3. Microphone: slight dent on top
 4. Freq. counter: ONE segment of ONE digit burned-out.
    All other stuff is in"A-1" condition.

Thats why I got my 2 Sidewinders off of eBay from a person who had them
converted by a CB shop tech. The band switch on my radios is also the
unmarked top middle button so I have the newer version too.

Simple.

Their is a small diode near the modulation transformer (the big thing on the rear of the radio, towards the right hand side). It is usually made of glass, and has a lead sticking out of each end.

Should have a device number like Dxx

You can clip one end of this.

Then, near the "finals" of the radio (in quotes because their is only one final in this chassis) you have a black slug in a clear or brown covering that you can turn in and out.

Remove that slug.

Done.

See about 20 to 25 watts.

Not necessarily.

Build a multiport combiner (4 port for an 8 pill) and you have a combiner that is less lossy than one that combines the two amp boards, then one that combines those.

>
>
>
> > They are a <<bit>> lossy, but do work.
> ---
--
> --------------------
> How would you tie multiple stages togther any more efficently without
them?

I would use larger cores than Texas Star, I would use different permeability than they use to get more inductance.

I like how tight they wrap them, though. Makes for less RF being "thrown about" due to tighter coupling.

I seem a bit perplexed as to
> how, and why, a licensed ham can not perceive this

Because it is nearly unheard of in the VHF area where he is licensed.

I highly doubt he has experienced 6 meters yet.

Yes, I was referring to DSB...

Double SideBand Supressed Carrier.

Harder to make a simple typo that way!!

I am thinking about purchasing a Texas Ranger 696 F. I am comparing the radio overall to a Grant XL. Whats the over all quality of the 696F compared to the Grant XL? How bout the receive? Is the NB very effective? Drift on SSB?

The main question is- are they like the older uniden/cobra's or like the new jokers cobra is putting out?

I like a freq. counter built into my radio, but if it has the problems of the 148F I'll buy something else.

I have a Newmar Travel Trailer (made with aluminum siding) and I put up a "No Ground" antenna made by I believe Wilson. The coax that comes with these kinds of sticks are measured to provide the best SWR possible under the circumstances. Inside I am using a low end Midland that is probably ten years old and has had the internal speaker removed by someone a while back so I use an external speaker. This rig enjoys a SWR of 1.5:1 across most of the channels with the higher ones moving to probably 2.5:1 area. This is not a problem because all I need it for is to communicate with the tow vehicle when the two are not at the same place at the same time.

Perry

:
:>Well I have found a program to download on the internet that was sappose
to
:>let you. But it didnt work. Acording to the people I talked to they had it
:>themselves. I did pick up my uncle across the road on my computer. He has
a
:>150 watt amp thing hooked to his cb though if maybe that had anything to
do
:>with it. Sorry not good with the technicle terms yet. Just getting my
first
:>cb in a couple of weeks, so I'm a newby at this.
:
:>Spiker
:
:What you mst likey experienced was his illegal amplifier bleeding over
:onto your computer's speakers. The radio simply overloaded your
:amplieier in your speakers. It is common for illegally amplified CB
:radios to interfere with consumer electronics. In rare cases, also,
:perfectly legal radio setups can do this, due to poor filtering in many
:audio/video products out today. CB amplifiers, being illegal, obviously
:have no technical standsrds for quality control. As such, many of them
:are rather dirty. Also, many CB operators modify their radios, which
:cause this "bleedover effect" due to cranking their radios beyond design
:limits. Couple this dirty radio with an amplifier and you really have
:problems.

The microphone wiring for the HR2510 goes like this:
This is the PinOut for the OEM HR-2510 Microphone that has President printed on it.
1. Audio
2. Shield
3. Transmit
4. Channel Up
5. Channel Down

For the Astatic Mic:
1. White
2. Shield and Blue
3. Red
4. n/c
5. n/c

Yellow-Not Connected.
Black-Not Connected.
These were used before to change the channels up and down that you cannot do with the Astatic. No harm, No Foul! Who needs to change the channels with the mic anyway.

Hope this helps.

Perry

Anyone can give me some help?

I need a freq break down of all the US CB channels

Thanks

Lloyd

Hey Jerry,

Quit "dickswinging", it's just a hobby.

Bob.

Well lets see smart ass. Does your TV have expansion slots? Can you load
IBM or MAC compatible software on your TV?

So chew on this DICK Tracey. It would only take a relatively simple
board/circuitry to be placed in an expansion slot and software to drive it.
Gee, sounds like a AM/FM Stereo Tuner Card, doesn't it?

Jackass!

Hank

Hey Shark:

I just put up my I-MAX 2000 right at the end of my house. I have a single story ranch with brick veneer. The Roof Gable is about 18" from the attic vent where I put a short bracket. the antenna is atop 20' of steel mast. I used a RS ground spike to secure the end of the pole but otherwise I did not use any guy wires or such. It is pretty solid. I will say that this fiber Glass vertical can generate allot of static with the wind blowing by it, so I sincerely recommend that you provide the project with a good earth ground to bleed that stuff off. And, use some of those standoffs every 3-4 feet of coax to keep it away from the pole and to prevent the feedline from moving around allot. With my base radio all hooked up, I am getting 1:1 SWR readings and getting out really well. Have fun and hope this helped.

Perry

If you wanted to do a real full duplex from one radio that would
be most expensive and pretty difficult as I don't know of any radios

capable of this.

You could certainly do a full duplex if you used two radios and two antennas. You would need to mount the antennas as far as possible away from each other.

If you just wanted to talk on one ch. and listen on another in half duplex fashion, that would be easy enough to do on one antenna.

I've got a Cobra 36st handheld that I'm trying to get better reception
on. I just tried 4 foot magnetic mount antenna with no luck at all.
Is my CB just too small and crummy to be of any real use?

Hi, all;
There are some great sellers on eBay- and then there are some

who are not. One in particular is a user that has the name
"LADoctor" and also used "Doctorld" Please beware of this
seller. Do your best to look for someone else that has a similar
item you are looking for. I received one item that looked like
had been in someone's barn for 40 years. And the other, which
I haven't received after almost two months, also looks like crap.
It was sent to the WRONG PERSON and he sent me pics of it. It is
a piece of junk! BEWARE.......

You mean the advise dosen't agree with all the cb made up mythical
theories, so it must be wrong.

I guess I'm a little dense, but how do I use FM to find someone on AM?

I checked out the Ramsey DF-1 and spoke to tech support. They
don't have any specs on their website for the frequencies it will
work with, but the tech guy said I could use it with a CB.

I'm waiting for a reply from Copper about their "Signal Hunter".

Thanks, everyone, for your helpful input.

Charley

Any have info on the Silver Eagle 200 amp?
I have one and and wonder who made it and it could be retuned to the Ham 10m band?
Im a ham myself working on Gen class upgrade..

Also those on the W. Mi. area, Im with the USCBOA and have signed up to be local Rep.
If youd like more info you can email me or contact me via AIM

I just talked to someone at Wilson. They are not out of business. Yes, they were sold but they are keeping the name. They are moving their operations to Illinois. They will still be made in the U.S.A. and they plan on staying the leaders in CB antennas.

Yo Scott,

I just did explain it. The Voltage ratio of the transformer is equal to the turns ratio.

The Impedance Ratio is equal to the SQUARE of the voltage ratio. Read it again, and if you still don't understand I'll try explaining it a different way.

Dick's original question, Arnie, was the following:

> Lets see, now.... Where is the commercial radio demand for
>RTTY, PACTOR, PACKET, or CLOVER? Or SSB?

My comments did not address the considerable use of CW on the amateur bands because that was not what was asked.

The reference to knuckle-dragging was meant to zing those like Dick who seem to have no use for any mode other than CW, and not meant to zing people who enjoy the use of that mode IN ADDITION to regular use of other modes, whether mentioned in the discussion in question, or not. If the shoe fits, feel free to model it for us, otherwise, keep those knuckles up where they belong and have a nice day. :-)

73 and good DX'ing,

Mot everyone...I highly doubt his claim, too...but as far as I'm concerned, that's subordinate to the fact that presumably, each of those claimed contacts exceeds 250 kilometers distance from his home 10-20 and thus is illegal under Part 95.

73 and good DX'ing,

Thanks for the help. I am still confused by gentlemen talking about base of antenna having to be 37 feet of ground. I never even using a 10 foot mast on my old one story one have been that far up and still have good gain. anyone else expand onthis for me. also am I understanding I should use like coax clips not wire wrap to mast
thanks. I also have heard that I can buy 18 guage chainlink fence top pipe at a fraction of the same pipe sold as mast. is this true

I have been told you can purchase chain link fence top post for about 5.00 for

10ft.
Is this the same pipe as masting for much more?

Then you have a problem. Time to get your act together and align
TX and RX together.

>Thats why radios built with seperate Tx/Rx, that is a locked Tx and
>a clarifier for the Rx.]

That's the biggest flaw in a SSB cb.

>The reason for this is that not only are
>different manudactures going to be off, but temperature fluctuations

Who cares if they drift? If RX and TX are tied together then they'll
drift together.

pill but you
> guys work the whole world with 25 watts?

When conditions are in, yes.

I have a hard time hearing the next
> town over when they run 25 watts on 11 meters.

I don't have that problem, but I run a real antenna... A beam.

although there are some rare
> conditions.

Not rare, real!

> IM not just saying I cant reach them I am saying I never heard them. I
heard
> Canada a couple times..
>
> I am talking about with an antron.

Get a real antenna, and you will be pleasantly surprised!

I dont believe he was necessarily looking for explanations as to why he WAS receiving bleed-over but rather how he can enable his computer to listen to the 27 MHz band.

So once your comprehension level meets or exceeds the standards of a moron, come argue your previous post with me, until then..... keep reading.

Hank
(keeping the family tree on the same branch)

PS - I'm assuming Bell Atlantic doesn't require an aptitude testing do they?

people on this group dont understand what we talk about because there am only ducks. 25 watts wont get you no where on am and on the regular 40 but find a clear freeband freq and thats all you need. i still say that 32 pill isnt gonna make you king of the east coast but you should be able to talk good between keys. go listen to 27555 usb any morning and youll hear european stations all morning long. evidently your one os those guys that never leave the regular 40 am.

ps its harder for you to hear canada because your closer. there in my radio almost daily full scale on the meter

That is because many hams are still stuck in the past or have a much
bigger case of nostalgia, than they realize. I think the point that John
was trying to make is that if CW is obsolete from a commercial
standpoint, then the only reason that hams still cling to it like
rusticles on the Titanic, is for purely aesthetic reasons. There isn't
much that CW gives you that a more modern mode cannot (And usually with
a much faster BPS rate).

> modification for this unit is all over the internet and i had no problem

> finding it, but, what i was not aware of until i received the radio and opened it up to convert it, was that Eagle has changed the circuits in the radio to make it harder to modify for frequency expansion. So, i ordered the Tip & Tricks video # 9 tape that has different types of modifications for the Sidewinder, all the while wondering if the tape, shot 2 years ago, had been updated to reflect these circuit changes made to the radio, but assuming that no tech, except a crooked one, would continue to market a modification video for a specific radio that was no longer accurate because it was outdated.
>
> Well...the Tips & tricks video tape #9 from Coppers Electronics is outdated. And, if you purchase it to get the 400 channel frequency conversion information you will have wasted your money, and will have been ripped off. All the other information on this tape is still valid, but the 11 meter channel conversion information as presented, is impossible to effect because the circuits that the video instructs you to alter are no longer there. So, do not buy the video for channel expansion until they update it and make it current, or you will be THROWING YOUR MONEY AWAY! They have even put a picture of the new radio on the video box, (has no Ch9 print on the upper level center button on the front panel), old ones did, to make you assume that it features the channel mods for that radio. IT DOES NOT!!! Only for the old one...period. That they put in an effort to change the photo on the video box from the old radio to the new one, proving that they realise that the radio has been changed, but did not update the channel expansion information accordingly, seems to point to a willful intent to defraud. You decide, but it seems that way to me.
>
> This is not a complaint about Coppers service or products in general, i have had really good service from them. But, only that this tape has not been kept current to reflect changes made the unit concerned.
>
> I figured out the new channel modification procedure, and made this change to my radio last night, and i could not be more pleased with the results. I now have 400 channels, 5 kc's up or down for each one, USB, LSB and FM. For the money, this is the best 10 meter unit i have seen.
>
> As we all know, money is hard to come by, and i would feel really bad if i thought more people were getting ripped off on this video like i was, only because i did not speak up.

I had a friend that also bought that radio from Copper, and also got bit with the "old information". But he called their tech and he was able to get the proper information for the newer version, from their tech support. It took a day or so for the tech to get back to him, but the information was good.

> No vote needed, its already been done. Its called FRS.

Not the same thing. FRS is VERY low power with VERY limited range, and is designed for personal communications over distances of less than 3 miles.

GMRS is available too, but has limited frequency usage (You basically apply to use 2 frequencies, and that's all you can legally use).

What we were bandying about was the original CB band usage, with nearly the same range, on a band more conducive to this type of operation. I picked the 72-76 Mhz band for several reasons.

1. The band is higher in frequency, and will not have nearly the DX opportunities (and associated local interference).

2. The band is "odd", in that there is little commerical or ham equipment that can be adapted to it, which would lessen the amount of illegal power and frequency mods available.

3. The band is still low enough in frequency, that signals are not
strictly line of sight, like UHF, and will still provide a decent ground
wave direct range.

4. there is less commerical interest in this band than those higher,
which are prime candidates for paging, digital phones, and wireless
internet services. The FCC could "afford" to allocate 40 or 50 12.5 Khx
FM channels for this new "CB band"

5. and hey, 72, is 27 backwards.........

But it's doubtful that this will ever happen......

There is a bit of a difference between an otherwise intelligent person, with just a bad attitude (Or wild opinions), and someone with absolutely no concept of civility. Most of the yahoos on 75, are fighting each other over a difference of opinion (Religion, politics, whatever). The idiots that terrorize CB do nothing but swear, dump carriers, play music, and other annoying traits for the sole intention of disrupting communications.

Yes, there are idiots everywhere, but it's much easier for a true idiot to buy a cheap CB, than the go through the trouble and expense of getting on ham radio.

If by this you mean that CB is multi-faceted and constantly changing, then yes, this is true. But like you wouldn't eat Filet Mignon that's been soaking in cat piss, it's tough to enjoy the "good" facets of CB, when the all of the "bad" ones pop in and out on a regular basis, especially if you have kids or friends that might be offended at what they hear. If I am embarrassed enough to have to turn off the radio when visitors are present, there is SOMETHING wrong.

I am fully aware of the "pockets" of decent fun still to be had. That's why I'm still here. I'm hoping that when I move 30 miles further out in the next 2 weeks, that I find a new and better group of people to get to know.

I have NEVER seen a radio that has the clarifier unlocked, and the mod
done properly, ever be "out of sync" with the TX and RX. The oscillator
frequency stays the same, as long as the voltage reference is solid.

>
> Thats why radios built with seperate Tx/Rx, that is a locked Tx and

And you've just gave the biggest reason why radios should not have fixed
freq. TX. Since all of the radios cannot possibly be on the same exact
frequency, taking all of the temperature, age, and manufacturer
variables, then trying to have a roundtable QSO becomes painful, since
every one will have to adjust their RIT each time a different person
talks.

I'm still waiting for SOMEONE to explain to all of us, just how you can accurately "net" your independant variable TX frequency to that of everyone else on the channel, without having to go 3 or 4 rounds of "how's this", with every station on frequency and then adjusting RX, and how this is supposed to be faster, than just tuning the synchronized TX/RX to one single station ONCE. Sure you might be "close enough for government work", but that's not good enough to eliminate the need to touch up the RIT everytime a different person talks.

I've been running SSB for over 25 years now, and we've had, by far, the least amount of problems when everyone's clarifier is "unlocked".

That antenna was formerly known as the "Super Maxim". It was a 1/2 wave
design, slightly less than 18 feet, with 3 short radials.

In the middle 70's, these antennas could be had for $24.95, but had a
nasty habit of the SWR climbing in the rain, due to the matching
transformer, not being weather sealed very well.

Great radio. Not the same or "clone" board as a 148 or grant. Peaks up better than 148/grant.

I have been trying to get people on this group to read what Walt Maxwell and others have to say on antenna/transmission line matching, but it seems that no one wants to read-- just argue. Thanks for pointing out Walt's work on-line. His latest work should be published soon, and will be announced on rec radio amateur antenna. It may already be out, and will be worth the effort for all radio operators to find a copy for permanent reference.

it doesn't make any difference where that switch is....cal just calabrates the meter for reading the swr and pwr shows the reletive power output....if its not hearing anything with conditions the way they are then it needs to go to a shop for service....cause it ain't working..

It works because the device you're using switches antennas back and forth. This switching causes the signal to be 'phase modulated' right at the antenna. The net result is that you have an AM signal coming in with an FM 'distortion' riding on it. The FM distortion is what is telling you the direction. When you turn so that the antennas are receiving the signal equally, then the FM distortion riding on the signal is zero. You need the FM receiver to receive this FM signal riding on the AM signal.

It would definately work if the guy was throwing a dead carrier. It would work to varrying degrees if the guy was talking. You'd just have to pay attention the the 'tone', not to anything else. If the guy was transmitting SSB, it might still be usable, but it would be tough to really distinguish it accurately.

tnom:
I downloaded the article and I'm looking it over. M. Walter Maxwell's article appears generally quite accurate except where he tries to blame transmitter overheating to a coupling problem and not reflected power despite the fact that he wouldn't have a coupling problem if it were not for the reflected power. He has submitted to the same pitfall that many do when a lumped element analysis is performed on a circuit consisting of distributed elements.

HIs idea of proper coupling is a conjugate match. This is fine and I agree that achieving a conjugate match is extremely desirable. But just remember that a conjugate match is not equivalent to 50 ohms. They are only the same when you have no reflections (i.e. 1:1 SWR). In other words, a 50 ohm transmitter does not provide the power re-reflection described by Maxwell; you will need some other impedance.

Let's set the coupling issue aside for the moment. Beyond what I've already said, many of Maxwell's sentences, when taken out of context, can give an inaccurate interpretation. This is what you are suffering from.

It would be impractical for Maxwell to include all the necessary qualifiers in each and every one of his sentences to render them 100% accurate for 100% of the time. You must understand the context of his sentences for total accuracy.

Let me point out a few of M. Walter Maxwell's statements from that article.

1) "Rational and creative thinking toward antenna and feed-line design practice has been absent for a long time, having been replaced with an unscientific and thought-inhibiting attitude.

Yes, tnom, he's got you pegged.

2) "...all power reflected from the line/antenna mismatch which reaches the input source is conserved, not dissipated, and is returned to the antenna by the "antenna tuner" (transmatch) at the line input.

Note that re-reflecting the power *required* an antenna tuner. A 50 ohm transmitter without an antenna tuner would have absorbed the reflected power.

3) "All reflected power reaching the source is returned to the load, as part of the forward or incident wave."

This sentence best illustrates my point about misinterpreting statements out of context. Left alone, this sentence is not true. Maxwell used it in the context of describing conditions with a conjugate match.

The statement is true with a conjugate match.
However, if you have reflections on your transmission line, a 50 ohm transmitter does *not* provide a conjugate match without retuning (which would then make it some impedance other than 50 ohms) or an antenna matcher.

Bottom line: For a 50 ohm transmitter, reflected power does flow into the transmitter where it is dissipated as heat. It is an irrefutable fact.

George Warner

CW for aesthetic reasons? That may be a good word for it. I would have used the word *fun*. Hams like CW for much the same reason that equestrians like horses, even though there are more modern modes of transportation.

The problem is that many people can't separate the issues of the *CW mode* and the *code test*. They attack CW because they don't like the code test.

Try to think of it as the separation of church (the CW religion) and state (the FCC code test)...

In article <warnergt-1911991029430001@du132189.lan.ptd.net>,
warnergt@ptd.net (George Warner) wrote:

> I downloaded the article and I'm looking it over. M. Walter Maxwell's article appears generally quite accurate except where he tries to blame transmitter overheating to a coupling problem and not reflected power despite the fact that he wouldn't have a coupling problem if it were not for the reflected power.

Let me follow up on this paragraph. Here are three statements from Maxwell's article:

M1) "Reflected power does not flow back into the transmitter and cause dissipation and other damage. Damage blamed on reflections is really caused by improper output-coupling adjustment -- not the SWR."

M2) "Total rereflection of the reflected power at the line input is the reason for its not being dissipated at the transmitter."

M3) "...no [reflected power] dissipates in a properly coupled transmitter..."

The first sentence of M1 is not a general truth. It is only true under a certain specific condition of a conjugate match -- which, by the way, is

the focus of Maxwell's article.
What Maxwell calls "proper coupling" is obviously a conjugate match.

Also, Maxwell states that transmitter damage is dependent on improper output-coupling adjustment.
He further states that "reflected power... [will] alter the line coupling..."
It is intuitive and obvious that the output-coupling adjustment is dependent on the SWR. Any change in SWR would require readjustment.
Yet Maxwell states that transmitter damage is caused "not by the SWR."

If A is dependent on B, and B is dependent on C, how can A not be dependent on C? It is obviously flawed logic that is promoting a misunderstanding of reflected power.

M2 suggests that if total rereflection did not occur, reflected power would be dissipated by the transmitter.

M3 suggests that an improperly coupled transmitter *would* dissipate reflected power.

So, can (not does) reflected power get dissipated in a transmitter?
Maxwell seems to say that it does not while suggesting that it can.

I don't know if Maxwell is assuming that all of his statements are being interpreted in the context of a conjugate match, or if he is just using a poor choice of words, of if his interpretation is outright wrong. I think it is the first case.

Ironically, after accusing other authors of "perpetuating the unscientific and erroneous viewpoints" he is unwittingly feeding other errouneous viewpoints.

Don't get me wrong about the article; it is overwhelmingly accurate and very good.
Within the framework of a conjugate match, no reflected power will be dissipated by the transmitter. Is this what he meant when he said merely no reflected power enters the transmitter? Let's hope so.
He could have made it clearer.

He talks of the myths of lost reflected power; reflected power is no myth and it can easily be lost but his overall theme is correct in that it doesn't *have* to be lost.

Just gave into a whim and bought a uniden grant xl. It works well on AM but I
have yet to raise anybody on ssb. Is it possible that it isn't transmitting on
ssb? It receives well on all three modes (am, lsb, usb). I've even heard some
dx from arizona and nova scotia (im in nothern virginia).
Try as I might, I can't raise any contact on ssb. Local or otherwise.

SWR is 1.2:1 through my 102" whip and AM is working well.

Any advise? Is there a channel I sould try over the others? There dosen't
seem to be too much traffic on ssb except for maybe lower 33.

Thanks.

Well, while SSB is more efficient, it does seem to be more
'competitive' at times. Which can mean it can be tough to
make a contact.

But you got a meter on the radio, right? When you tx in AM,
it should show transmitted power. When you are in SSB, it
should show nothing at all when you don't talk, but bounce
around like an undamped VU meter when you talk. If it does
this, chances are fair to midlin (GOOD!) that the rig is
transmitting. Now the question is transmitting what? But
if it's putting out 'something', and everything else works,
it's probably putting out something correct.

Just keep trying.

Mike

Just be sure to use an antenna matcher to get the SWR to below 2:1,
otherwise it's bye-bye output transistor !!!

Get some coax and peel back 18 feet of shielding from around the
center conductor. Then, stick it up in a tree next to your room.
Drape the other end with the PL259 into your window and connect it to
your CB. Viola, you now have a halfwave dipole.

You're wrong on this one Dave. Dig back thru your QST magazines. Several years ago the boys at Fort Collins/Bureau of Standards proved that ionospheric heating from land based transmitters is not only possible, bit practical. If you'll find the article and read it you will be quite surprised!
They even went so far as to state that a handful of legal limit amateur stations would be enough to "create" the phenomenon!

This was the "early" research which helped spark project HAARP.

Your turn to read again! In most typical base antenna installations, there is a sizeable component of the signal radiated towards the ground underneath the array. When this rf is reflected back up underneath the array to the feedpoint, one of two things can happen, depending on the height above ground. It will either arrive back at the feedpoint in phase with the incident wave being generated by the antenna or it won't.

If the feedpoint is located at a height equal to a wavelength or any multiple of whole wavelengths above ground, the incident wave is reinforced by the return of the reflected ground wave, however if this is not the case, cancellation between the incident wave and the reflected wave occurs instead, preventing optimum operation of the antenna in question.

Flip the radio upside down with the front panel facing you and remove the bottom cover being careful not to pull on the speaker wire, which you should dis-connect at that point. Near the front panel of the radio you will see a small circuit board that is elevated from the main board and is mounted inverted with its circuit traces facing upward. Remove the soldered tab that is connected to the chassis and serves as a ground, making sure that no solder drips or splats onto the main board below, then remove the phillips screw that holds the board in place and remove the board. Look on the component side of the board for a series of three small holes labled Con1, if the radio has solder filling hole one, remove it, and solder holes two and three together. It is very easy to confuse the holes because of the layout so be careful.

The modification is very easy, and what Eagle basicly did was to remove the three pins that pins two and three were shorted out on with a plastic jumper block as you would see on 2950 etc... and leave three empty holes there that you short out holes two and three with solder.

Thats it...the unmarked top center button is your band select, and you will have 10 bands of 40 channels. The LCR button serves as a -5 or +5 kc up or down adjustment. The other buttons function as marked. Do not crank up your AM power & SSB power!! Leave them as stock because this unit has no heat sinks and runs hot!!! Even with a 1.1 SWR it runs hot, so leave it at 4 watts AM, 12 watts or a little under SSB, or you will burn it up!!!! Leave your modulation limiter in place and crank your modulation pot fully clockwise. Run the microphone gain on maximum if using the stock mic, and hold the mic about 8 inches from your mouth and you will get out loud enough and clean enough that people will find it hard to believe that you do not have a power mic. Alot of features for the money!!   So Long.

The Kenwood, yeasu, tower is easily worth that, some people will give a $150 for the 2000 gtl speaker and have you priced 60 amp 16 volt xfmr's lately? I think it is a fair deal, one mans trash is another mans treasure.

The radio is nothing like the new Cobra radios. Ask Bill at Bill's 2 way or Rich at left coast, they will tell ou this is a good radio.

Mike

Regardless Of amp size, which he never told you what he COULD run, antenna's play a key role in how good you transmit in DX, Im sure I will get flamed over that claim, but I truly believe this because of test's that I have done.

yes it is, but the reception depends on who is downloading the audio for the
web and where they are located . there is a place you can go to on the web
for this . take care and start looking,...icm out.......

Pardon me if I remain skeptical on this one. I might buy that THEORETICALLY, you might be able to create an unpredictable, temporary, unstable and limited range ionospheric "condition", through the focussed application of very high power, that may result in longer than normal communications. But I don't believe that it could be applied practically or reliably for world-wide HF DX. At least not in the way the CBers who believe it do.

Sometimes, in order to make a point, you have to get graphic......

Sorry about your meal.....

Dave

If you want small, the PDL-2 is the one that everyone tries to beat.

If you can live with it, the Moonraker 4 or its Maco (shooting star)
equivalent is nice.

If you want one that will last a thousand years, get a Joe Gunn... His
antennas work very good, and last, and last, and last! The down side is the
price.

Toll Free

: one antenna, might be harder....

Hi Robert,

It's possible using a few different plans, but what I think you might be
heading for is someone to describe a CB repeater. Here we go...

Requires two radios on, one on channel 40 the other on channel 1.

The audio from the channel 40 radio is taken from the speaker jack, placed
through a circuit where it's reduced in level and isolated, then presented
to the mic input of the channel 1 radio.

the channel 40 radio is your receiver, the channel 1 radio becomes your
transmitter.

The Squelch or meter circuit of the 40 channel radio is also sampled and
it's output drives a Carrier Operated Relay "cor" circuit which keys the
channel 1 microphone anytime it sees a signal above a certain level.
You end up with some kind of fun here because CB is mostly AM operation

which is not as friendly to noise as the common fm repeater is. That's the nature of am vs fm.

Operation:
So, you and all the repeater users are driving around with radios that will offset/split it's transmit frequency from the receive frequency. Like the operation of the common 2 meter radios hams use.

All of you listen to the repeater output on channel 1, any transmissions will have their radio tx on Channel 40, the repeater will hear it and rebroadcast it back for everyone else on channel 1.

Everyone hears channel 1, everyone talks in to the repeater on channel 40. That's also pretty much how the ham and commercial repeaters work except they most often use FM modulation.

There are some technical issues which need to be dealt with. You would need two seperate antennas for each radio. The average receiver for a cb is pretty bad at rejecting the nearby transmitted signal. You would need to add some filters know by various names into the antenna line.

Even better would be to also add filters into the transmit line.
In the real world you would have to make some serious compromises to get a system to operate properly.

Enough of the proper filters wired properly may be called a duplexer. Isolation is provided by enough filters placed in the transmit and receive coax lines that the outputs of both tx and rx filters are combined and sent off to one antenna. Remember that your cb repeater transmitting on channel 1 and receiving on channel 40. That term is your frequency seperation of about 410KHz which is pretty close and hard to do right for most people.

There are other situations that work well... I build a lot of repeaters for the Ham Clubs in Northern California and I tune cavities and duplexers all the time. You can email me direct if you have a detailed question. I'm happy to help those that want to learn.

good question
cheers

You can probably get Compainies like Mini Circuits and Amidon to sell you made up baluns, but I think I saw you saw that you'll want 100, wow... gonna be pricey...

Go to the Amidoncorp web site and order the balun cores you need for your frequency range. If your not jamming a lot of power through a core, the T-50-2 is probably what you want.

Pick up a copy of the ARRL Handbook from Ebay and the baluns your looking for are shown. Save yourself some money and time plus you can beat a Handbook for an overall reference for radio work.
All the bologna you see posted about impedance and ratios is properly explained in the Handbook with winding information.

It's a great amplifier, one of the best ever made using sweep tubes. In addtion to a great circuit, it also goes 40-10 meter amateur. I've fixed a few in the past and the problems were most often operator error (overdrive).

snip

His account of transmitter overheating is correct. Try this experiment. Take a 100 watt amp, or any transmitter that is convenient. Measure the amperage at a 1:1 match. Then take the same amp and through the use of a tuner or any or any other method create a 2:1 match. You will see a doubling of the amperage drawn by the amp. Could this be the heating effect of a high SWR?

>Let me point out a few of M. Walter Maxwell's
>statements from that article.
>
>1) "Rational and creative thinking toward antenna and feed-line design

>Yes, tnom, he's got you pegged.

Could you quote the part where he mentions my name?

I assumed he was referring to you??? After all he asks "Have I fallen prey to any of the erroneous teachings?" I think that describes your belief on this subject, not mine. Besides I have not attempted to do anything scientific or unscientific. I have just been trying to set you straight.

>2) "...all power reflected from the line/antenna mismatch which reaches the

>
>Note that re-reflecting the power *required* an antenna tuner. A 50 ohm
>transmitter without an antenna tuner would have absorbed the reflected
>power
.
You are making quite a jump. Where does he say a tuner is REQUIRED for re reflection? You better read it again. A tuner is only required for COMPLETE re reflection. Even without a tuner the transmitter re reflects most of the reflection. The transmitter does NOT look like a 50 ohm load to the reflection so that it reflects most of the power back to the antenna.

>3) "All reflected power reaching the source is returned to the load, as
>part of the forward or incident wave."
>
>This sentence best illustrates my point about misinterpreting statements
>out of context. Left alone, this sentence is not true. Maxwell used it
>in the context of describing conditions with a conjugate match.

Then read this stand alone statement.

"Reflected power does not flow back into the transmitter and cause
dissipation and other damage.Damage blamed on reflection is really
caused by improper output coupling adjustment - not by SWR"

>The statement is true with a conjugate match.
>However, if you have reflections on your transmission line, a 50 ohm
>transmitter does *not* provide a conjugate match without retuning (which
>would then make it some impedance other than 50 ohms) or an antenna matcher.
>
>Bottom line: For a 50 ohm transmitter, reflected power does flow into
>the transmitter where it is dissipated as heat. It is an irrefutable fact.

If it is you should write your own book.

It may be easier to just re-read Reflections. You are still assuming
that a reflecting wave will see a perfect 50 ohm load at the
transmitter. Therefore it will be consumed as heat in the finals.
Well, the truth is the reflected wave does not see a perfect
load and hence is mostly re-reflected.

Hello. I am a serious collector and restorer of old vintage CB and shortwave
equipment,I have been collecting this type of equipment for 15 years,,since I
was a teenager. I am looking for any old SBE catalogs or Lafayette Radio
Electronics catalogs. Look around your basement,,,maybe in the attic,,,how bout
grandads shed full o junk? If you have any vintage CBs,acc, etc,,,regardless of
make or model,please e-mail me with make,,model,,condition(working and
```

physical), and asking price(reasonable please) or trade, etc. I would like to develop a small vintage CB museum somewhere down the road for old radio buffs like myself. I have alot of new and used parts and items for vintage equipment. If you find yourself looking for some gizmo that goes to that old CB set,,dont be afraid to look me up. All e-mails will be answered promptly. Thanks for reading! Hope to hear from ya!
Glenn

Hi, I was wondering if the Galaxy DX-55V had echo in it. I was thinking about getting this radio's for Christmas. If it doesn't have echo, i was thinking about buying a D-104 M6C mic. That would probably be a nice crisp sounding radio.

Thanks Buckaroo "223"

Complete re reflection is obtained by the use of a tuner
Even without the use of a tuner most of the power is still re reflected.

Read the section where he describes not using a tuner and then adding a tuner.The power is not dissipated in the finals in either case.

Part 6.

Reflected Versus "Lost" power

Mr. Jones,

I couldn't have said it better. Your post was absolutely brilliant. It just is beyond my ability to comprehend, why people *must* attack CW because they don't like the code test. Where you listening, John? Because someone likes and uses CW, does not make them a knuckle-dragger.

Regards,

Arnie-

Why would we need you.

Last time people asked for mods you replied that their where too many.

Never did give them the modifications that they asked for, either.

I've got an Expander 500 sitting on my shelf. Since they don't make it anymore,
it must be a collector's item. Anyway , Pfffffffffffffff to you .

Your right... You don't know!

The way you're going, maybe
> we'll have a chance to find out.

I suppose you have proof of this statement, Joe?

You wouldn't want to make slanderous comments, would you?

Wait.. You have in the past.... What kind of fool am I to believe that you would have stopped being such a pompous little boy?

Perhaps there are no local SSB users in your area. To test your radio, arrange for a AM friend, with SSB on his radio, to switch to SSB with you. Maybe when others hear the two of you talking on sideband, they will join you.

> SWR is 1.2:1 through my 102" whip and AM is working well.

Try the LSB of channel 38 (27.385 MHz). It is the most popular SSB frequency in the US. In fact, it is customary for U.S. sidebanders to use channels 35 through 40 (mostly LSB). Older SSB users, who predate 40-channel radios, can still be found using channel 16 (or is it 15??), again mostly LSB.

There is a bill in Congress HB2346 trying to legislate this.  Some areas
are jumping the guns.

If you want to hear your radio better, maybe. If you want more
transmit power, than absolutely not (not the right circuitry).

My neighbor's radio is ruining my life. I don't want to rag on anyone's hobby. I'm a compusive net nerd myself and don't particularly like people telling what I can and can't do online neither, but I am getting my neighbor's CB clear as a bell and as loud as a large bell, through my stereo and recently even through my cable TV. His 40' antenna is a frisbees throw from my house. Can anyone tell me what this is all about, and what I can do about it while still being a good neighbor? So far I have only heard such suggestions as straight-pinning his coax. I don't consider that a good option.

Did you have anything to do with the repeater that GEARS uses?

They have a kick butt system... I used it for a couple years.

Cecil,

My problem, as I have stated, is when people trash CW (the mode) so they can score points as an NCTA. Because they don't, won't, or can't use the mode, is not a valid reason to denigate it. You have stated on many occasions, that you have nothing against CW (the mode), that's fine. But when, John makes a blanket statement about CW = Knuckle-draggers, when I doubt he has ever actually used the mode; then I find the comment unwarranted. As you know, CW is something that must be experienced in order to gain a valid opinion about it's use or enjoyment value. Simply coming to a conclusion without ever experiencing it, is like saying I hate swimming without ever being in the water (how do ya know?)

Regards,

Arnie -

My friend...

I am originally from the west coast, and when the sun goes down, so do the conditions...

The islands are far enough away that when conditions are rolling for them,

the West Coast is getting an earful of them, just as much as the people in
the midwest.

Dont do anything with R124 & R126 if you want to use that radio on SSB.

Hey look ASSHOLE. I sure the hell didn't come on here to lie about anything.
For your information if you looked at any of the other posts there are ways
to hear cb's on your computer. What the hell is your problem man. I came on
here looking for help and your just trying to be an asshole. I have better
shit to do then come on the computer and make up lies. Frankly I have been
looking over this board and would like to thank the people that did try and
did help me. I have noticed that allot of people on here like to fight. Damn
this is a message board if you want to fight about shit make a fight board.
some people have better shit to do. Also to whoever keeps making the coments
to me trying to make me look stupid (dont feel like looking up the name
right now) I said in my main post that I knew absolutley nothing about this.
I am trying to learn and what i have seen from some of the people on here I
don't know if getting a cb is worth the money if there are going to be
assholes like you on it. Thank you Hank for sticking up for me and helping
me out.

For those interested,

Filament 16.3 volts @ 600amps

Typical operation:
Plate 20,000 volts
Screen 1,500 volts
Plate I 45 amps

Water cooled and 170 lbs.

Well, in a sense, he's right. CW is old. Knuckle-draggers are old. In a
lot of ways, I'm a knuckle-dragger.

When I applied for a job in Federal Law Enforcement, I had to take a series of qualifying examinations. One of them involved abstract reasoning. You are the absolute master of that, Cecil. : -)

To answer your question:

When we die, I believe we can go to only one of two places. Based on the day I had today, this would not be a good time to go :-)

Regards,

Arnie -

Could you possibly clue me in to which bill was enacted into law and who it's sponsor(s) are? I know of many pending, but none that were enacted into law that give specific jurisprudence to local municipalities to enforce federal law. Please be more specific, if a correspondent of mine in DC dropped the ball on this one, I need a new protege if my publicist finds out.

Dave,

They did more than that. It's
no longer a theory. The "theory"
has long been supplanted by factual
case history evidence!

    I must be from another planet or something. I can't imagine what
the possible problem is here regarding getting "on frequency" with
the rest of the group.

Having done this since the late 60's, I can assure everyone here that an unlocked clarifier is the way to go. I mean having the Tx follow the Rx. Anything other than this will definitely lead to confusion and wasted time trying to get everyone on freq.

If one of the stations has a tin ear then simply move to that person and be done with it. Tell that person to not touch his frequency control.

Somewhere here someone mentioned Ham rigs are best about frequency accuracy. I can say with some authority that Ham rigs are not the last word in accuracy. Most of them come out of the box a few tens of cycles off and as they burn in, they get worse just like a fresh cb. I say it's not uncommon to need a touch up on the reference osc. in most new Ham rigs after a few months go by.

And finally, who really cares if when you finally all get together if you're a few tens or even hundreds of cycles away from dead nuts on center slot? It's not gonna' matter much at all.

For the nit picker who is gonna' tell me all about ocxo's and tcxo's in these new rigs, don't bother. Been there, done that. Got the "T" shirt and the cap.

Finally! Someone has finally gotten to the correct answer. I tried to say this exact thing but either y'all think I'm a blithering idiot and won't read my posts or it didn't make it to the NG.

I am assuming that some of you work in two way and should be familiar with crowded repeater sites wherein a combiner along with a isolator for each tx is used.

I would also assume those familiar with my example also realize just how easy it is for the output of one tx to find its' way back into another tx final and cause all kinds of intermod. Hence the need for isolators/circulators.

Also, the reflected power can and does destroy a final not just by heat but by overvoltage as well. I qualify this with an example. If anyone here is familiar with two tone or multi-tone testing of an amplifier you will immediately remember the relationship between the power output of a single tone compared to a two or more tone drive.

You should remember the 6 db difference between the single tone and two equal (in amplitude) tone output powers. This 6 db higher output occurs when the individual tones are in phase and combine in output. The frequencies do not need to be that close together for this to happen.

Remembering this 6 db factor, when the reflected power makes it's way back into the final stage tuning networks, the phases of these signals will at some point be "in phase" causing the voltage in the tank circuits and ultimately the transistor collector to increase.

The actual increase at the collector and in the network could be more or less and depends on the network and the magnitude of reflected power. However, when the final is already driven near it's limits due to applied modulation voltage peaks and you throw in an additive peak of that same modulated signal from a reflected wave, you can see a considerably higher rf voltage at the collector and higher peak voltages and currents in the network. This could cause the transistor to break down.

Another aspect of this returned in phase voltage is that the design of an output network for a transistor is partially based on the expected peak power the stage is going to put out. When you add more voltage to the collector than the tuned stage was designed for, you change the collector load impedance to something the network wasn't designed to transform. In most cases, raising the collector voltage increases the collector impedance which now forces the output network to present a mismatch to the collector and ultimately allows there to be an even higher voltage on the collector just due to this mismatching.

In any normally working tuned stage for rf, there can be voltages and currents available across certain individual components that may be much higher than the applied dc values. This voltage might cause a breakdown in a cap or maybe arcing across a coil turn. A cap may be already running close to its dissipation limits for current and if that cap has any appreciable loss tangent then any excess currents due to incorrect collector impedance matching or just the presence of reflected power might serve to cause an overdissipation condition through that cap. i.e. heat, sometimes a lot of heat. Coils are typically lossier than caps and can become overheated under these same conditions.

So, whoever said heating of the final was the result of reflected power, take a bow you are correct.
Whoever said the final can and does act as a load for reflected power, you are also correct.

I remember seeing a couple more correct assertions here but I don't feel like going back through all the posts to find them, sorry.

The Galaxy 55V does not have echo, but has a roger beep. The D104m6b is a
great choice to go with that radio.

I've had great success using fence posts for masts.

> I was just wondering what radio was your first. My radio was back when I hit 14 and my father got me the strangest thing. He got me a Gemtronics 40 channel radio. The Gemtronics, was a big beast. Had tubes in it, but this wasn't that long ago. It was 1979, and they still made this radio. It was great, but being young, I sold it about 6 months later, and put down the money on a new RS TRC 449. Now that was a great radio. AM, and SSB mobile, with a chrome face. Best radio Radio Shack ever made. It was a copy of the 138 GTL, and it was moded from 25 to 30 Mhz. I miss that one too. Well, tell us some stories folks.
>
> Mo
>

Here goes.... My first CB was a Globe President 8A which I bought with allowance money for $15 in 1972. As an 11 year old kid, I had no idea that using the family TV antenna for my CB would eventually burn the PA to a crisp. Second radio was a new Lafayette Micro 12, then I got an Eico 771W from Uncle Charlie. I loved it but it had a highly unselective receiver....I heard everything across a 5 channel range. Then I had a Lafayette He-20B, Johnson Messenger I, and finally a Sonar FS-23 (great radio)...then I became a ham in 1975....I still have the Sonar, Johnson, and both Lafayettes. I would LOVE to have that Globe President 8A !!

I have used it up to about 40 ft with omni antennas. I drill a couple of hole
through the joints and bolt them together. The stuff I have used was pretty
stout. There may be some lighter weight stuff out there I dont know about.
Actually if I could find some lighter material I would like to use it for boom
materialand upper sections of the mast..

Well, if my radio is at one temperature and drifting a certain amount,
and your radio is at another temperature and drifing a different
amount, and the Tx/Rx are locked, then if I tune my Rx to your Tx,
then you will not hear me correctly, so you'll tune to my Tx, and then
I am no longer hearing your correctly because, since your Tx/Rx are
locked together, you just also retuned your Tx, which I had previously
tuned my Rx to. At this point, neither of us will ever be able to
tune each other in and talk also.

Exactly right, but this requires a seperate Tx and Rx tuner, not both
locked together. This way you can first stabilize your Tx given your
particular radio and climate condition. Granted everyone will have to
tuned their Tx to a net controller who is telling everyone that they
are in sync. Then, everyone just tunes their Rx to any one of the
particular radios in the group and it will be correct for the whole
group.

Go to radio shack (sorry for the potty mouth) and get a pack of RF CHOKES and install them on the speaker wires as close to the speaker as you can this should help with the speaker problem . try a high pass filter for the tv , you can get these at different places so shop around. good luck

You need to listen for some locals and try to make a contact with
them.  If your trying to work DX on a stock radio your gonna need a
base antenna stuck up very high.  You can make some DX contacts in
your mobile but it will take some luck on your part.

Tell your neighbor what he is doing. If he is unwilling to help rectify the situation he is technically breaking the law. Ie: If he says to you, "Shaddup ya' f-ing *ssh*le!" If he's causing serious interference, it is quite possible that he is using an illegal amplifier. Then it becomes the business of the FCC. However, if it is the fault of your equipment then there is little you can do. Speaking in gross generalities, lower price consumer electronics are more likely to be interferred with as they lack the shielding of superior equipment. You get what you pay for. I had my station "inspected" a number of years ago because I was wiping out a neighbor's clock radio. Everything checked out okay at my station so the inspector broke the news to my neighbor. Much as I was in the right, it wasn't good PR. But that's okay, I just moved!

Selling to help settle a family estate

There is one tube driven CB, It's made by Johnson, it says "Messenger"
on
the front and there is a casting of a Viking, so I presume it's a Viking

Messenger. The model # is 242-128. Chrome front. From what I found out
this is what they called a "White Face"

There is one tube missing, as well as 8 of the 10 crystals. However, if
you
can dig up a schematic or tube diagram and let me know what the tubes
and
crystals are, I probably have them here (tons of crystals and tubes from

this estate) SALE CANCELLED - UP FOR GRABS AGAIN.

The other CB is a Midland. Model #77-155. Looks like your run of the mill
radio, transistor. No mike attached to it, but it's a four pin connection.

I also have a very old Marconi/Raytheon Models 1583D and 1585B, two pieces
of a set. This is a mobile radio, tube driven at 6 volts. Freq. 162-172

Mhz. It has some parts missing, Like crystals, but nothing of the
circuitry. 30 watts output. Has a very old hand held mic attached to it.
Looks like something that Andy Griffith would use :-)

email me with your offers or questions

William

Greetings!

tnom, don't forget that the final network to arrive at an unbalanced
impedance, can also accept power and reciprocate this power to provide
a far lower impedance impinging on the load the final delivers into,
to be converted.

As far as I can tell, there is no CB on the market designed to absorb this energy except for conversion to a lower impedance to be dissapated by the final.

I see no provision in a typical CB radio to "reject" reflected energy, unless I'm missing something in the way the output network and the 52MHz trap are designed, these things are two-way pipelines.

As far as I can tell, the working load on the output conversion of the low impedance of the final to the higher impedance of the network seems to be the hot spot and where energy is converted to heat competing with forward [different phase angle] energy at the finals own impedance against the working load at the other side of the output network conversion, or the reflected energy be re-converted to a lower impedance.

Is this what Maxwell is trying to tell us?

I'm open for comment on this, flame if you have to, but it is an interesting coversation at this point...

While Dancing with the Mouse on 19 Nov 1999 17:14:03 -0600, the Modem interrupted with an MNI from "tnom@mucks.net", and the MotherBoard buffered this to Video RAM:

:+>
:+>
:+> snip
:+> >I downloaded the article and I'm looking it over. M. Walter Maxwell's
:+> >article appears generally quite accurate except where he tries to blame
:+> >transmitter overheating to a coupling problem and not reflected power
:+> >despite the fact that he wouldn't have a coupling problem if it were
:+> >not for the reflected power. He has submitted to the same pitfall that
:+> >many do when a lumped element analysis is performed on a circuit consisting
:+> >of distributed elements.
:+> snip
:+>
:+> His account of transmitter overheating is correct. Try this
:+> experiment. Take a 100 watt amp, or any transmitter that
:+> is convenient. Measure the amperage at a 1:1 match.
:+> Then take the same amp and through the use of a tuner
:+> or any or any other method create a 2:1 match. You will see
:+> a doubling of the amperage drawn by the amp. Could this
:+> be the heating effect of a high SWR?
:+>
:+> >Let me point out a few of M. Walter Maxwell's
:+> >statements from that article.
:+> >
:+> >1) "Rational and creative thinking toward antenna and feed-line design

:+> >unscientific and thought-inhibiting attitude.
:+> >

:+> >Yes, tnom, he's got you pegged.
:+>
:+> Could you quote the part where he mentions my name?
:+>
:+> I assumed he was referring to you??? After all he asks "Have I fallen
:+> prey to any of the erroneous teachings?" I think that describes your
:+> belief on this subject, not mine. Besides I have not attempted to do
:+> anything scientific or unscientific. I have just been trying to set
:+> you straight.
:+>
:+> >2) "...all power reflected from the line/antenna mismatch which reaches the
:+> >input source is conserved, not dissipated, and is returned to the antenna
:+> >by the "antenna tuner" (transmatch) at the line input.
:+> >
:+> >Note that re-reflecting the power *required* an antenna tuner. A 50 ohm
:+> >transmitter without an antenna tuner would have absorbed the reflected
:+> >power
:+> .
:+> You are making quite a jump. Where does he say a tuner is REQUIRED
:+> for re reflection? You better read it again. A tuner is only required
:+> for COMPLETE re reflection. Even without a tuner the transmitter re
:+> reflects most of the reflection. The transmitter does NOT look like a
:+> 50 ohm load to the reflection so that it reflects most of the power
:+> back to the antenna.
:+>
:+> >3) "All reflected power reaching the source is returned to the load, as
:+> >part of the forward or incident wave."
:+> >
:+> >This sentence best illustrates my point about misinterpreting statements
:+> >out of context. Left alone, this sentence is not true. Maxwell used it
:+> >in the context of describing conditions with a conjugate match.
:+>
:+> Then read this stand alone statement.
:+>
:+> "Reflected power does not flow back into the transmitter and cause
:+> dissipation and other damage.Damage blamed on reflection is really
:+> caused by improper output coupling adjustment - not by SWR"
:+>
:+> >The statement is true with a conjugate match.
:+> >However, if you have reflections on your transmission line, a 50 ohm
:+> >transmitter does *not* provide a conjugate match without retuning (which
:+> >would then make it some impedance other than 50 ohms) or an antenna matcher.
:+> >
:+> >Bottom line: For a 50 ohm transmitter, reflected power does flow into
:+> >the transmitter where it is dissipated as heat. It is an irrefutable fact.
:+>
:+> If it is you should write your own book.
:+>
:+> It may be easier to just re-read Reflections. You are still assuming
:+> that a reflecting wave will see a perfect 50 ohm load at the
:+> transmitter. Therefore it will be consumed as heat in the finals.
:+> Well, the truth is the reflected wave does not see a perfect
:+> load and hence is mostly re-reflected.

```

Greetings!

Agreed, and I wish the FCC would understand this. I sure would make
SSB a lot more interesting to a lot more people.

While Dancing with the Mouse on Fri, 19 Nov 1999 08:15:47 -0500, the
Modem interrupted with an MNI from "Dave Hall
<nojunkmail_n3cvj@worldlynx.net>", and the MotherBoard buffered this
to Video RAM:

Greetings!

Just what does happen when those "quantum states" of electrons when they hit such a frigid boundary of 0 Kelvin?

Do they fall onto the floor - or would that pose a problem with the Weak and Strong forces in those little Gluons.

Or would everything just "Gluon" together until the antenna collapses from all that weight?

Or would it's "spin" torque itself off the mount?

While Dancing with the Mouse on Thu, 18 Nov 1999 17:52:53 -0500, the Modem interrupted with an MNI from ""Toad Stool" <toad@stool.com>", and the MotherBoard buffered this to Video RAM:

The lightest you should use would be schedule 20 1 3/8" top rail. I'd suggest
schedule 40. These come in 21' sections for about $18ea

Greetings!

In brief...

Connect antenna.

Turn the channel to channel 20.

Switch knob to CAL.

Press the PTT, or key up the radios Transmitter.

Adjust SWR CALIBRATE knob until the S/RF needle in the meter meets the small red triangle that says CAL on the face of the meter.

Unkey radio, switch this knob to SWR.

Re-key the radio, don't move the "SWR CALIBRATE" knob, look at the meter and you can read the SWR directly.

Note those 1, 2, 3 SWR numbers, if the needle goes above 2 or 3 on the meter, unkey and don't try to key this radio up for longer that 30 seconds at a time - you're running a high SWR and the antenna needs to be tuned.

To help you figure out where your antenna is best tuned for, switch the channel to 40, and keep the knobs as they are, then check SWR on that channel - still above two or three, note the location of the needle on the face of the meter.

Do the same for channel 1, and let's compare notes...

Channel 1 lower than channel 40 but still above 2 or 3?

Better check that antenna;

> move it to another location,
> or if you are not sure of the condition of the
> antenna, try using another one, better look
> at using a newer antenna than that.
>
> Lot's of times, the coax, or the antenna itself, gets
> water in it and corrodes, ruining the match.

Check out my page for a reference if you need help figuring out what needs to be done...it'll save bandwidth...

http://www.iserv.net/~codyspc/antenna1.htm

Hope this page helps.

I have convinced a formerly Possessed Satanic friend of
mine (relative, actually...my brother) to convert to the
ways of the Lord Jesus and sell his Evil, Vicious, Demonic
linear amplifier.

I bench tested it myself, works fine. It is a Matcoe 225
Plus with preamp. Hi/Med/Lo power levels, cosmetically a
7 out of 10, I don't know what kind of transistors are in it
but I can go over to his house next week and take a look.

Asking price is US$100 including shipping to lower 48 states.

If interested please email at dmcnut@juno.com or if you want
you can email me.

Praise the Lord and pass the Moonraker Four!!!

Here is what you said in your previous post:
>It was kind of weird when i talked to my uncle on here. I just talked through my mic.
>I asked if he could hear me and he said yes. Then shortly after I lost the connection....

Now, your trying to tell me that you talked to your uncle on his CB by using your computers sound card mic? Excuse me, I don't care how much you say it happened, but I know that this is totally impossible and you must have just thought you heard your uncle saying yes to you. Bleedover on your computer from a CB is entirely possible and happens every day.

The reason your getting the responses that you have been getting is that a lot of people like to come to this newsgroup and post stupid messages which try to irritate the regulars on this group.

>For your information if you looked at any of the other posts there are ways
>to hear cb's on your computer. What the hell is your problem man. I came on

Yes, I know about all the ways to hear HF on your computer. But you said one thing that was totally farsicle and that was that you talked to your uncle using your computer! This is laughable at best.

>here looking for help and your just trying to be an asshole. I have better
>shit to do then come on the computer and make up lies. Frankly I have been
>looking over this board and would like to thank the people that did try and
>did help me. I have noticed that allot of people on here like to fight. Damn

No, a lot of people here just get tired of reading posts about
ridiculus things by people who post them just to waste our time.

I just recieved a galaxy saturn base and am very confused by operations of this
radio after mods.
I have owned a galaxy 2527 and galaxy mobile export radios in the past and they
were easy to use when all bands opened up. THis radio seems to either be
difficult to use or maybe was modifyed incorretly. It seems the 10k switch is
disabled or is giving me 11 meter band when switch is in 10k up posistion and
band switch is set to band "d". the problem is that while some channels work
and freq counter is correct it seems to skip some channels example I was
hearing same channel on channel 27 and 28 and another same conversation on
channels 39 and 40, Also I notice some channels are missing example channel 7.
They clarifyer cant slide it down all the way when on channel 8. when I try
putting 10 k
switch in down posistion it seems that the freq counter doesnt move when
changing channels.
very confused.... can someone please help me understand if this radio is right
or are saturns not easy to operate like there cousins when modiyed.
thank you very much
Tod Kertz

So the FCC are knuckle-draggers, eh? The administrations of almost
every other country issuing HF amateur licenses are knuckle-draggers? I
think I have this straight--they and anyone who supports a continued
morse testing element for HF access are wrong. You, a person who can't
keep his stories straight and who leans toward fabrication, are the

enlightened one. Does that about sum it up? I sure wish I could take you seriously.

Im trying to decide on a good solid all around antenna for my GALAXY SATURN basestation.I will be using it for the 11 meter band , just the regular CB channels. Two models that I am considering are the ANTRON 99 and the MACO V-50. I dont need anything fancy , just a very good working antenna that I can use to talk a pretty good distance from my base and shoot SKIP on occasion.

Some say that the ANTRON 99 is a good choice , others refer to it as a spatter stick. Some say the MACO V-50 is a good antenna , others say it is too flimsy and does not hold up in stormy weather. I plan on putting the antenna up about 100 ft in my cedar tree , and some people say that a ground plane is not necessary with an antenna that high. Would a ground plane be just a waste of money when you have the antenna that high?

Any info you could share with me would be greatly appreciated.

You may E-mail me directly if you wish.

Thank you , Edward S.

Sounds like a pl problem or
it not aligned right.Take it back
too whom you got it from.73,Scotty's Radio

I got radio from an honest guy. I just confirmed that with 10 k switch in up
position whitch is the one posistion and band selector on D, I went around dial
and it is the same channel each two steps i.e. there seems to be only 20
channels and 20 are missing. the channel selector led shows all forty but the
freQ counter and my other radio confirms that it is stepping in 20 kc steps.
any help?

can you or anyone tell me what is the standard way to modify the saturn bases
for
freqs and clarifyer so I can guess if this was modifyed correctly..
Thanks so much. I really like galaxy but it seems something isnt righ

The gain of this antenna is aprox. 2.5 dbd omni and aprox. 5 dbd
directional. This is from the makers specs of long ago and please
don't ask me to find the papers for you.
BobC.

A CB repeater would be very difficult, not just because of the small freq
shift, but also because of all the noise and number of people using the
bands. It would become practically useless when skip rolls in because it
would by keyed up so much. You'd need an alligator timer to keep from
overheating the transmitter! If they would make packet legal on CB in the
US, then everyone could have a digipeater, and it would be much easier than
attempting a voice repeater! They are having great success with packet on
CB in Europe, maybe the FCC will consider making it legal someday.

What your mate is talking about, is using an "inverted V"

Don't bother with all this stripping coax, just buy an 18" length of copper earthing cable, it's a lot easier, cut in in half (2 x 9" lengths).
Now cut back about 5cm of insulation from the end of your coax and seperate the inner conductor and outer braid. Now connect the outer braid to one of you nine foot lengths and the inner conductor to the other using terminal block. Attach this whole assembly to the highest point of the roof (find some where away from any obstructions or metal piping) and run the lengths of copper cable along the rafters following the line of the roof to create an inverted V. You will need to then check SWR in the usual way. You will need to cut the ends of the copper cables equally and a bit at a time (careful here as you can't stick bits back on!!) untill the SWR reads the same at your highest & lowest channel, and is lowest in your middle channel.

If set up correctly this will work as well as any other type of loft antenna, and be a great deal cheaper.

If you need any more info, email me and I'll go into more detail or supply a
diagram.

Also be aware that these aerials can cause TVI probs due to radiation
from the co-ax, which can cause all sorts or probs.

Ideally you want a balun which is easy to make, but probably outside
your budget if you buy one.

Check your SWR carefully, but a 2:1 SWR would be what i would expect
without a matcher.

If you're really skint you can use commonly available "hook-up" wire
from maplin etc. The thin stuff would be for low power only, but it
would get you on the air for pennies.

Or i can do a new half-wave for �12+p&p :-)

> follow the Rx.

This is fine if every radio is tuned to a high degree of accuracy. However, if even one radio is out of tune, the entire conversation is in trouble. And there can be a number of reasons that a radio is out of tune (poor tuning in the first place, poor maintenance, temperature drift, etc.)

Lets give a quick example. You and a friend are talking. Both of you are using perfectly tuned radios, so both of you are able to easily tune each other in.

Now another person wants to join the conversation, but his radio is slightly off. The two of you tune your radios to him. But, since your tx frequency changed when you changed your rx frequency to hear him, he now has to retune again.

And, since his tx frequency changed when he changed his rx frequency to hear you, now both of you have to retune again. And then he has to retune. And then you have to retune. This could go on endlessly.

When the tx and rx are not tied together, the tx frequency does not change as you adjust your receive to hear another. Since everybody's tx frequency remains constant (even if not perfect), all that is required is a quick adjustment of the receiver as the different people talk. Once you get the hang of this, this adjustment is rather painless (its easy to remember the knob position for each person).

> If one of the stations has a tin ear then simply move to that person and be done with it. Tell that person to not touch his frequency control.

But he has to adjust his radio to hear you after you changed your radio to hear him (remember that your tx changed as you adjusted your rx to him). And since his tx and rx are tied together, and his tx changed as he tuned his rx to hear you, you will now have to readjust to hear him. And then he will have to readjust. And here we go again, endlessly.

> Somewhere here someone mentioned Ham rigs are best about frequency accuracy. I can say with some authority that Ham rigs are not the last word in accuracy. Most of them come out of the box a few tens of cycles off and as they burn in, they get worse just like a fresh cb. I say it's not uncommon to need a touch up on the reference osc. in most new Ham rigs after a few months go by.

That is true to some extent, but most ham radios are tuned better at the factory. And they tend to use higher quality components, so there is less shift due to age or temperature. And, on the higher end ham radios, there is circuitry included to monitor and regulate frequency drift, insuring an even higher degree of accuracy.

drew3D wrote:
>
> My neighbor's radio is ruining my life. I don't want to rag on anyone's hobby. I'm a compusive net nerd myself and don't particularly like people telling what I can and can't do online neither, but I am getting my neighbor's CB clear as a bell and as loud as a large bell, through my stereo and recently even through my cable TV. His 40' antenna is a frisbees throw from my house. Can anyone tell me what this is all about, and what I can do about it while still being a good neighbor? So far I have only heard such suggestions as straight-pinning his coax. I don't consider that a good option.

Okay, you will need to talk with your neighbor about it, since both of you will need to work together to solve the problem.

He will need to insure that his antenna, radio, and any other radio devices, are properly grounded. He will also want to insure that he is using good quality coax and that his antenna is tuned properly (low SWR). After all this, he may also want to consider a bandpass or lowpass filter.

It is also possible that he is using an illegal linear amplifier to boost the power output of his radio. If this is the case, he may need to turn it down or turn it off.

You will need to insure that your cable television system is properly grounded. Look for a copper rod in the ground near your cable service entrance (the box outside your home) and a heavy wire running from the cable service entrance box to the ground rod. If you don't see one, call the cable company (this is required, so there should be no costs involved). After all this, you may want to consider a highpass filter for the back of your tv equipment.

Use the shortest wires possible for your stereo speakers. And don't leave the wires a tangled mess behind the stereo (tie each wire up neatly in a tight bundle). Remember that any wire on the stereo can act like a wire antenna, so eliminate as much wire as possible (or give it a low capture area by tying it in a tight bundle).

All this should solve your problem nicely. By the way, if he refuses to cooperate, you may want to consider a nice letter to the FCC. In fact, just the threat of this may change his mind about cooperation (especially if he is using illegal equipment).

Flip the radio upside down with the front panel facing you and remove the bottom cover being careful not to pull on the speaker wire, which you should dis-connect at that point. Near the front panel of the radio you will see a small circuit board that is elevated from the main board and is mounted inverted with its circuit traces facing upward. Remove the soldered tab that is connected to the chassis and serves as a ground, making sure that no solder drips or splats onto the main board below, then remove the phillips screw that holds the board in place and remove the board. Look on the component side of the board for a series of three small holes labled Con1, if the radio has solder filling hole one, remove it, and solder holes two and three together. It is very easy to confuse the holes because of the layout so be careful.

The modification is very easy, and what Eagle basicly did was to remove the three pins that pins two and three were shorted out on with a plastic jumper block as you would see on 2950 etc... and leave three empty holes there that you short out holes two and three with solder.

Thats it...the unmarked top center button is your band select, and you will have 10 bands of 40 channels. The LCR button serves as a -5 or +5 kc up or down adjustment. The other buttons function as marked. Do not crank up your AM power & SSB power!! Leave them as stock because this unit has no heat sinks and runs hot!!! Even with a 1.1 SWR it runs hot, so leave it at 4 watts AM, 12 watts or a little under SSB, or you will burn it up!!!! Leave your modulation limiter in place and crank your modulation pot fully clockwise. Run the microphone gain on maximum if using the stock mic, and hold the mic about 8 inches from your mouth and you will get out loud enough and clean enough that people will find it hard to believe that you do not have a power mic. Alot of features for the money!!   So Long.

Thanks all for the suggestions.
I'll try using proper protocol to raise a local.

Yes the RF meter bounces like crazy when I transmit so you are probably correct in that is putting out power.

I had an old cobra-138 twenty years ago. I seem to remember that the clarifyer adusted both tx and rx. Maybe I'm remembering this wrong.

I'm not trying to work a lot of distant states with my mobile (yet), I'll just have to scare up a local ssb.

Thanks to you all

What do you do once you found the offender? Does the FCC care about 11 meters anymore? If you report the guy, will anything come of it?

Or should you just start burning effegies of him on his lawn?

Sounds like someone did a great job 'modifying' your radio. Next time,
consider the possibility that it might be a good idea to leave well
enough alone and just talk on it.

Greetings!

Any mods for saving channel memory when power is disconnected?

Is there a way - without always having "reinitialize" to 10 meter defaults?

While Dancing with the Mouse on Sat, 20 Nov 1999 07:28:41 -0500, the Modem interrupted with an MNI from ""Carl" <cdpope@erols.com>", and the MotherBoard buffered this to Video RAM:

:+> Flip the radio upside down with the front panel facing you and remove
:+> the bottom cover being careful not to pull on the speaker wire, which
:+> you should dis-connect at that point. Near the front panel of the radio
:+> you will see a small circuit board that is elevated from the main board
:+> and is mounted inverted with its circuit traces facing upward. Remove
:+> the soldered tab that is connected to the chassis and serves as a
:+> ground, making sure that no solder drips or splats onto the main board
:+> below, then remove the phillips screw that holds the board in place and
:+> remove the board. Look on the component side of the board for a series
:+> of three small holes labled Con1, if the radio has solder filling hole
:+> one, remove it, and solder holes two and three together. It is very easy
:+> to confuse the holes because of the layout so be careful.
:+>
:+> The modification is very easy, and what Eagle basicly did was to remove
:+> the three pins that pins two and three were shorted out on with a
:+> plastic jumper block as you would see on 2950 etc... and leave three
:+> empty holes there that you short out holes two and three with solder.
:+>
:+> Thats it...the unmarked top center button is your band select, and you
:+> will have 10 bands of 40 channels. The LCR button serves as a -5 or +5

:+> kc up or down adjustment. The other buttons function as marked. Do not
:+> crank up your AM power & SSB power!! Leave them as stock because this
:+> unit has no heat sinks and runs hot!!! Even with a 1.1 SWR it runs hot,
:+> so leave it at 4 watts AM, 12 watts or a little under SSB, or you will
:+> burn it up!!!! Leave your modulation limiter in place and crank your
:+> modulation pot fully clockwise. Run the microphone gain on maximum if
:+> using the stock mic, and hold the mic about 8 inches from your mouth and
:+> you will get out loud enough and clean enough that people will find it
:+> hard to believe that you do not have a power mic. Alot of features for
:+> the money!!   So Long.
:+>

Greetings!

Ceramic have higher tonal response, but a greater volume of output.

Dynamic are bacially little 600 ohm speakers, like a tweeter in a speaker cabinet. Have the better fidelity of all those listed. Low output and are impedance termination sensitive, the output on the element and the input of the amplifier, need to be equal for best transfer of energy.

Electret are powered by a small voltage, and have a frequnecy response and volume of output similar to the tonal response of Ceramic.

Crystal has a sharp tonal range, and has an output voltage similar to Ceramic. Very narrow frequency response.

Controlled magnetics, AFAIK, are dual coil construction over a stationary magnet, with one coil that can be used as a NFB to affect the field of the other.

It's not just the element, but the case design housing it, that also determines how the element responds to audio.

A lot of Mikes on radios today, are Unidirectional - or pick the audio the best from one direction only. Most qualify as noise-cancelling.

Dynamics are more Omni-directional, but are put inside a case that is designed to deliver the best response and output, head-on, directly to the sound source.

My own pereference is the Dynamic types, due to the Fidelity.

While Dancing with the Mouse on Sat, 20 Nov 1999 01:09:31 -0500 (EST),
the Modem interrupted with an MNI from "thumper485@webtv.net (Chris)",

I bought a RJ-3250 Panasonic CB on ebay recently and I have some questions about it.1. anyone know when these were made?2. is this a good talkin, receiving radio?I think I'm only receiving about a mile, what would cause this? I'm using a Wilson 5FT whip, excellent match, brand new 18FT coax.I've heard a lot about alignment, could it be off on this radio, affecting receiving range? is aligning easy to do?I would like everyone's opinion on this radio. It's a nice looking rig and I would like to keep it, but if it's gonna be a pain in the ass, I'll buy a new one. Thanks guys!

Greetings!

Thats up to you.

People can retailiate.

This is whats so sad about the situation.

Personal and private property, under seige - the offender is going to win in court as being the "victim" due to a blathering of words. Even if he's drunk and being a public nusiance on the airwaves, but done at home.

More subtle ways are;
... to announce the address ...
... jamming with low-power RFI generators ...
... parking mobiles in the neighborhood, and constantly communicate back and forth while the offender rambles, usually on an adjacent channel, or even on SSB so others can hear the wisecracks being made on SSB, as heard thru the carrier the other jammer is throwing out...

The more damaging ones are physical in nature, and can wind you up in court...

Yanking off the antenna, or the coax, from the mast.

The physical measures are drastic, and should be avoided. Like the person doing all the interference in the first place, just ignore them.

If the offender follows you around on the channels, and makes verbal threats, you have more to stand on. Recordings played for others to hear can establish the premise of what is yet to come.

Just remember that recordings can also fall back on you, you lower your conversation level to the offenders level, you're just as guilty of promoting the retaliation and offensive behaviour.

But, physical confrontation on the doorstep, or anything done to his property, even phone calls - considered harassment, and you're in the wrong.

The keyword, is embarassment.
Not harassment.

Radio shack used a "different" supplier for the processor chip & specified that there would be no mods possible, unlike the similar Magnum 257, superstar 4900+ ect, which have the "mod-able" chip. Don't buy the HTx-10 version of that radio for out of band use, it won't work.

Hi everyone,

I need some help. My question may sound stupid for radio users, but I hope you will answer the following question. I have found the circuit of a device capable sending on the american walky talky band (49.8XX Mhz). That�s pretty cool, but since I live in switzerland, have some problems in finding such an american walky talky and don�t want to send on maybe "prohibited" freqs, I asked myself how I could change the circuit in order to send on the 27 Mhz CB band. Now my question is the following: is it possible, what changes should I do or is there somewhere a circuit in the internet that sends a signal on the 27 Mhz band?

The circuit is the following:

```
Ant.

Greetings!

Bob, first, thanks for taking the time to recognize the a CB radio with all it's inherent faults, can have a major impact on how people perceive SWR as being a "bad thing to have when it's high".

This is true for a lot of the CB radios on the market today, they reciprocate the arriving reflected power back to another impedance that is far different than the unbalanced output network can handle once it's arrived to the radios final section.

This power can be disspated in a myriad of ways, and combinations of such...voltage thru resistance, conversion of high voltage to higher current, and higher current thru passage into a resistance.

Conversion of the relfected power to the lower impedance thru the tank circuit is one of the many banes that cause finals to fail.

Due to the bandwidth of response on the tank circuit, the output of the final can have both forward and reflected power summing into the tank circuit and you have circulating currents and voltages, if not tamed, can literally blow up a final.

Another thread brought up a good point of unsing Zeners to prevent avalance voltages from exceeding the maximum ratings on the final.

Another is what you've stated, and that is the conversion of the reflected voltage exceeding the maximum ratings the finals junctions can withstand.

One of the interesting notes to pass along, is how this can be prevented by simply redesigning the amplifer stage to common collector or base versus emitter. Designing the impedance network is then an easier chore. In a CB radio final section, attributes of all three are combined.

If you take a look at the finals of many CB radios, they use a common base impedance thru the use of an R value with the collector seeing the load on both the audio and applied RF being passed thru a LCR network to the base as an input. The load is passed from the collector to the tank circuit and PI network, and into the load.

[We're speaking of the base region here.]

However the base is also referenced to ground for bias, but little voltage is applied and only for the class of operation of AB in some cases, but in Class C it's run in the cutoff region when no signal is applied - and they are biased so that the impedance network when reflected RF is high, the bandwidth at the input of the base is also high so as to help disapate energy before it goes to the driver. Due to the characteristic of the collector to base region - when base potential rises, the collector voltage begins to fall as power is allowed to arrive to the base region and with the bias resistor present versus the LRC network from the prior stage, this then sets a reference in which collector voltage follows the base regions own reference voltage set by R. The potential across these regions can be used to obtain gain, by using an LC bandpass.

But, bandwidth is used instead, to provide some "cushion" and isolation of power away from the base and into the emitter and prevent excessive power potenitals from rising above a reversed biased emitter to base situation. Hence, the fudgy "R" values.

Looking at the bias and LCR networks of the Final section, I see combinations of the various other configurations to help the transistor remain stable.

One thing I do notice, and helps with bandwidth, is the application of "fudgy" R values from Base to Ground - shared by the Emitter, part of the bias, yes, but also plays a role in the overall bandwidth of the amplifer stage.

Why do I bring this up?

Well, it's a good question <chuckle> but the design intent of these configurations seen in CB radios are to provide stability when the output network is no longer seeing a resistive load, and to provide a bandwidth in which the transistor can dissapate reactive loads by a referenced R value to ground present at the base and continue operating into the emitter.

Voltage and current rises at all points of the junctions, but the overall potential power differences remain stable for a wider range of energy levels thanks to R and the tank circuits ability to act as a step-down transformer and only provide higher currents which are less demanding than higher voltages.

I guess the key word here is, how an output circuit can fail is determined by the expected bandwidth that the device will be placed in. So, power is sacrificed to gain bandwidth to handle reflected power that cannot be terminated into a resistive element before entry into the tank circuit.

Something that Maxwell didn't touch on...which really plays an important role in how excessive VSWR and loading of the expected R+/-jX into the antenna system, can damage finals. Reflected power is reciprocal, and if the bandwidth of the amplifer stage is not wide enough, a VSWR of as low as 3:1 can cause damage. Simply due to what is described above.

As a secondary note, this also proves the summation problem. Then the +/-jX operator is reduced, the R value is paramount and plays an important role in dealing with dissapative effects the working R on the antenna system provides against reflective power effects on the tank circuit.

One thing he promotes, is a transmatch. Something a CB'er never will need if the antenna can provide for the proper R value [50 ohms] and has greater efficiency even though power level increase is small. The radio works into R, not into losses incurred by the +/-jX thru R.

Sure, you can use antennas that have R-values of 150 and above, but remember the use of the transmatch. Along with the overall size of the more popular CB antennas, they provide low R with higher +/-jX to arrive to a congulate match. So poor VSWR in these types of antennas can arrive to the damaging 3:1 VSWR that many radios can fail loading into.

While Dancing with the Mouse on Fri, 19 Nov 1999 23:52:21 -0800, the Modem interrupted with an MNI from ""Bob C." <bob@bigbird.reno.nv.us>", and the MotherBoard buffered this to Video RAM:

:+>   Finally! Someone has finally gotten to the correct answer. I
:+> tried to say this exact thing but either y'all think I'm a
:+> blithering idiot and won't read my posts or it didn't make it to the
:+> NG.

Regards!
:+> Andy <+:

 Huh, I always thought skip was the radio wave bouncing through the upper
Ionisphere, and then
finding a less dense pocket of O3, and the signal falls back to earth. But, I
guess I was wrong.

Skip is by No Means a way to iterpret antenna effiecency or range. Think about
the word first
"Propagation".

Well it could be a couple of things one a bad relay, and the options are take the
relay out and
see the what the Company name of the relay is and seeing if they are still in
business, and make a
call to them. Or find out if there is a cross reference for that relay. O r it
could possibly be
the cricuit that drives the coil for that relay. I would look at the supporting
circiutry for that

relay. Or let a Licenesed tech look at it first.

Your signal is backing up in your coax and bleeding off the shield.

What do you mean by a "flatline ant."?

HEY!!! HEY!!!! you two lovers take up love spat somewhere else, and leave the bandwidth to
people that want to talk about radios. Or find another news group like
rec.lovers.quarrel

i think you can go to earplugger's website and punch in what freq you want
and then listen, i don't know where the station is though, so you don't know

what you are going to pick up,....icm out........

I have a couple nets from the New England area and a link to possibly more
on my net page. Go to: http://www.cbgazette.com/gaz2.html
and click on the net/freq icon/picture

        A CB repeater isn't hard to put together. All you need is to
split site the system. We're only talking a block or two and a phone
line. You might even use a radio link like a 900 mhz cordless phone
instead of the phone line.
    It might take a bit of ingenuity but can easily be done.

Or a nice base for a lamp, you could drill 4 holes in it and bolt four 2'
firesticks to it, tie the tip of the together with a tiewrap, use coax to
feed the socket and you would have cool looking lamp  breaker  breaker!!!!!

99.5% of the echomongers do sound like crap. Occasionally though, I hear
some that use it in a totally tasteful manner, and it actually sounds kind
of pleasant.
.5% give or take, sound OK to me.
Just opinion.
Go figger.

In addition to what has been said the high impedance types (ceramic, crystal or stepped up dynamics) will have a tendency to sound higher pitched in a low impedance radio. A typical CB is 600 ohms and as far as these microphones go is low impedance.

Just the opposite happens when you try to hook a low impedance microphone (dynamic) to a high impedance radio. Some Ham radios (real ham radios) are high impedance. The result can be a muddy low pitched sound.

The best overall choice as far as i'm concerned is a condenser mic
You get a low priced, high fidelity, mid impedance microphone that should work good on anything.

Propane makes a great refrigerant. It is one of the only substances
that could be used in R-12 systems for replacement. The DOT won't
allow this. They don't like flammable stuff in your AC system.
Why don't they just ban gasoline? (I know, wrong NG!)

This has been covered in posts here in the past week. You did not mention
where or how the antenna is attached. My guess is that a coiled metal antenna
is no different in impedance than a 1/4 wave whip (36 ohms) and the same
things apply here. Make sure that your ground is good at the mount. If
you have it mounted on the trunk, ground the trunk lid to the rest of
the car. If you are using a magnet mount, ground the base of the antenna
to the rest of the car. See if any of your friends has a KW-7 FireStik
or maybe even a Skipshooter. Screw it on and see if the situation changes.

(then again, I'm a PC expert, CB is a hobby (more like entertainment!))

(Turn off your damn caps lock or do you scream at people?)

The open coils near the antenna connector form part of the radio's
LOW PASS FILTER. Do not mess with these coils. Your watt meter may show
more wattage, but it is coming out at 54 MHz. Since your antenna is not
tuned for this frequency, your SWR will rise, your final will run harder,
and it will burn up.

You need to specify which radio you are attempting to modify before
asking this type of question. You may want to look at:
http://www.bayshorenetwork.com/
and see if they have what you need.

Yes - that is the loop.  If you cut the loop to the right of it too, your
power will
almost double.

You illegally mod the radio. Take the normal TX static frequency and
tie it to the normal movable RX frequency control. Then make an
adjustment to align them together. If everything is done correctly
you will never have a reason to ask anybody for alignment advise
again.

OK,its not OK to commercialy manufacture CB amps or 10 meter amps easily modifiable for or intended for the CB band so WHY would it be OK to use one?The amp in question is an ilegal CB amp is it not?

Q'nQ (Quirkiness and Quality-wise) they are like apples and oranges, can't compare 'em and the 2510 wins hands down. The 2950 seems to get it's front-end overloaded easier, and tends to show off it's quirks more in mobile use than base station, but as far as display's go (especially mobile) it's the best I've ever seen, whereas the 2510's display (once again, for mobile use) is difficult to read during daylight hours.

GEEZ,you had to blow my cover,now everybody knows I sometimes check into a DX net to help a DX station get a card from Montana or to contact old friends,and THATS why I hang out on a CB newsgroup(a few minutes a day)?   Whats your point?It seems as vague as your address.

Check the relay coil voltage verses what the coil is rated for, If it's not a relay problem it could be some sort of power supply problem (Low voltage to the coil on TX)

I have a garage full of old and hard to find CB radio's. Base

stations, mobils, and HT's
I use them for parts when I need them but they keep piling up. I'll
sell parts or the whole radio. Let me know your wants. I also have new
electronic components. Discount prices
on all parts.
Thanks, Dave

No, it is made by Matco Electronics back East.

They are kind of an old amplifier, but they do work well.

Toll Free

Some people are in this hobby to have a sense of accomplishment when fixing something that isn't working when they buy it.

When you get a radio for 50 bucks, working worth 200 bucks, and you fix it for another 20 bucks, it is kind of nice.

On the other hand, their sure are a lot of appliance operators on 11 meters, just like on the amateur bands...

Those are the people who no matter what will listen to what someone tells them will work, when 100 other people tell them it won't.

You figure it out.

Adrian,

This shouldn't be too difficult to figure out. I used to have a TRC457 which is pretty much the same as the USA Washington. In fact it is damn near identical. I would first get the schematic of each. I can supply you with the USA version but I don't have the Aussie one. Compare the two, but check anyway. Going from memory, there are two cables from the channel selector. One goes to the PLL IC (uPD858c) and the other goes to the display. The PLL IC pins that are used are 13,14,15,16,17,18,19,20,21.This radio uses BCD, not binary, so you need more pins. Interestingly enough, pin 22 is pulled to ground in this radio. Fancy that! I wonder what would happen if you pulled it up to 4.68V? :->

Getting back to the Washington. The divider pins are attached to the channel selector's inputs known as 1,2,3,4,5,6,7,8. So chsel 1 goes to 13 and chsel 2 goes to 14 etc up to chsel 8 gong to 21. Got it? Good. In the Aussie version you might find that one or more of the higher order pins are pulled permanently to ground. This you will obviously have to rectify. Each PLL divider line must have a capacitor and resistor from it to ground. If it doesn, it won't work properly. The supply to the channel selector goes into chsel 9. This should register about 4.68V all the time. It is the supply that pulls the PLL pins up. The resistors I talked about pull them back down - very important. There is an additional line on the chsel, 13, that goes to 4.68V when the selector is between channels. Chsel 11&12 are tied to ground. If i had to guess, I would say that one is the ground for the PLL divider pins and the other is the ground for the LED display. There are 14 lines that attach to the LED display. The LED display has one line that goes to the + supply. So, the channel selector just grounds out the "bars" in the display that should be lighted. The + supply will vary in voltage depending upon where the dimmer control is set to. Expect about 2V for full brightness. This is all from memory so my apologies if I missed something.

Let me know if you need the schematic for the USA version.

Could I replace the RF final with a beefier transistor like 2SC1969 or 2SC2094 and add an external heatsink? I assume the Sidewinder uses a TO-220 packaged RF final.

This depends on who you ask. My personal favorite are the Shure Bros Controlled Magnetic Microphones. The 444D is a good example. These are un-powered microphones but tend to offer high-output and nice tone.

I'm not a big fan of crystal or cermic style microphones. Their days of glory are long gone and you won't find them used in any serious application.

Condensor electret style microphones offer good performance and they are dirt, dirt cheap to manufacture. Some are excellent quality, but most are not.

Hi Chris, I dont know right now still trying to figure what to do. I really
like the appearance of radio. You can tell it has been taken care of . Dont
know what the problem is . It may be the PLL or something to do with the 10 kc
switch. DO you
know how the mod is done in this radio? Do you have to use the 10 k switch when
modifying this radio. it almost seems where the problem lies. I noticed when
switching the 10kc switch to Normal It gives me like 3 bands but it only
switches freq about every 4 channels switched on dial...
If it was something easy but I dont know maybe I could fix.
thanks. decieding what to do..

There is a group of them, three or four, who make a game out of
harassing truckers in this area by powering up and walking on
them, playing their noise toys, jamming, and verbally harassing

them. The truckers would like to know where they live. I think
just keeping track of their addresses and giviing them to anyone
who asks for them is enough. But we could also get photos, post
them on a web page along with the addresses, drop by the local
truck stop, and post a few flyers. Other than that, I'll just ignore
them.

Charley

If I sometimes sound like i'm flaming, i'm not. I'm just being overly
sarcastic at times.

I'm not positive on exactly what Maxwell is saying. I'll have to re-read Reflections many times before it all sinks in. If you did read Reflections at http://www.arrl.org/tis/info/pdf/Reflect.pdf then pay attention to page 44 and especially 45. He discusses reflected power without the use of a transmatch.

The above section needs to be simplified like the example below. Assume a 3:1 match with a 100 watt transmitter:

Put yourself in the place of the reflected 25 watts. You have just gotten kicked out of your home and would love to find a 50 ohm apartment. You come upon transmitter that bombards you with100 watts. Hardly a static 50 ohm termination. You high tail your ass out of there and ask for permission to come back home.

I'll keep on using this one until i find a better one.

...would anybody want echo on a cb? I'm in the DC metro aera and we are chock-a-block with bozos with echo boxes turned so high you can't understand a word they say.

What are they thinking? I've even heard it on lsb. The last thing you need for lsb dxing is more distortion.

Roger beep I can understand. But the rest....they must not be able to hear themselves is the only explanation I can come up with.

Venting again......mlm....thanks for listening

No no no no no You are putting way to much importance on the exact
frequency you are operating on. As The Rock would say "It doesn't
matter".

>Granted everyone will have to
>tuned their Tx to a net controller who is telling everyone that they
>are in sync.

This in an unnecessary step, (how's that?), (is that any better?) if
TX and RX are tied and movable. If they were tied and movable you
would never have to ask anybody anything. You would only slide your
receive
into place and because of the tied TX it would be in place also.

>Then, everyone just tunes their Rx to any one of the

```
>particular radios in the group and it will be correct for the whole

```
horizontal is frequency
***********************************
My radio:            RX
                           TX

My  #1 contact                        RX
                                                  TX

My #2 contact            RX
                                    TX
```

```
***********************************
To correct this mis alignment two operators
simply tune their receivers in and that's it.
***********************************
Step one
                           RX
                           TX

                           RX
                           TX

                                    RX
                                    TX
***********************************
Step two:
                          RX
                          TX

                          RX
                          TX

                           RX
                           TX
**********************************
**********************************
***********************************

Your radio   RX
                                                         TX

Your #1 contact           RX
          TX

Your #2 contact                       RX
                         TX
***********************************
How do we correct this? How many steps?
Let's see............At the bare minimum five.
Doing it in five steps would take an event
like winning the lottery. In the real world it
would take at least eight or ten or even more
steps. It would be a waste of bandwidth to
show it graphically here just as it would be a waste
on the air putting up with operators that can't understand
how to run a radio, If that makes me an asshole
then so be it, but I have better things to do with my time
than tell someone they are on frequency.
***********************************
Please don't think i'm trying to flame. It's just that
it seems so common sense to me. I can't understand
why the untied scenario would ever be beneficial
in your normal everyday roundtable.
```

I've worked in computer stores for a long time, and have heard this question more than once:

"The program says 'push any key to continue', and I can't find the 'any' key."

You must live in a cave, Jack. BTW, Did you figure out how to put an upper sideband AND a lower sideband in the same place?

<snip>

I suggest you recalibrate on each frequency you switch to because
the output of the radio can be different on other channels.

1. What a dealer can buy something new wholesale shouldn't be a factor in a retail sale of a used or new product. What we as dealers can get something for (IMO) doesn't need to be shoved down someone's throat when they're trying to sell something. I find it more polite to just not reply, unless their asking price is unusually higher than fair market value.
2. The Matco (e) was made and sold in the mid to latter 80's, and was nearly identical to the TNT. A fair product, and at $100 used and in good shape, a fair price.
3. Not a dig at you personally Dave, just surprised to see that from you.

You know something fella, since you've come here, you've offered nothing but discontent and patronizing.
Carl is a very intelligent person, and a manufacturer of many innovative designs.
If you were old enough or had the experience, you would know that the items he's choosing to sell are worth well over his asking price.
A friendly suggestion to you is: if you don't have something nice to say, then don't say anything, if you are somewhat uninformed on something, don't make determined statements.
I'm sure you probably don't mean to, but you sure aren't gaining any alliances here the way you have been presenting yourself.
Then again, maybe the things you say are intentional, and if so, sorry I wasted the bandwidth and my time trying to change the "me" generation.

Your probably wanting a local discussion board commonly found on a
website?  A newsgroup is found in Usenet, which is not localized, but
rather world-wide.

i had 2 antrons myself at diferent times and had been pleased with both of them.

THE WAY THE THEROY GOES.

if you could "see" the signal radiating from an antenna like the A-99, it would look something like a big beach ball with the antenna sticking through the middle of it.
this is somewhat good for skip in some ways as the signal from the top of the "beach ball" is heading for the sky and, if conditions are right, will bounce off from the ionosphere to come down somewhere else.
if you add the skip kit, it will pull the shape of that beach ball down to something that resembles a doughnut.

this more or less concentrates the power of your signal by squeezing it into a smaller area and sending out toward the horizon at a somewhat higher ERP, (effective radiated power). like putting your thumb over the end of a garden hose. you're not getting any more water from the water company, just pushing the same amount through a smaller space while getting more pressure.
on average over flat terrain, the horizon is 12 miles before the curvature of the earth takes things on the surface out of the line of sight. this is why broadcast antenas are so high. i don't suggest this but if you were to climb to the top of one of these towers with a pair of binoculars and you'll see farther than 12 miles. this is why they have a greater than 12 mile line of sight range than your average push up pole.
also, at 100 kw to 1 megawatt, you'll get a nice tan from the inside out. :(
with this "doughnut" and higher ERP shooting straight out of the middle of your antenna toward the horizon, when it passes the 12 mile limit, some of your signal will follow the curvature of the earth, (ground wave), but more of it will pass to the ionosphere, (skywave), past the horizon and bounce off and land somewhere at a higher signal strength.
there are MANY variables when one speaks of skip like final polarization when the signal make land fall, (horizontal like a tv antenna or vertical like an antron), and which direction that it goes. this depends on season, the time of day, (position of the sun in the sky), and the 11 year solar sun spot cycle. the higher incidence of sun spots, the better for skip. regardless of wether you use a horizontal or vertical antenna and contrary to what some may believe, when talking skip, you have no control over the final polarity of your signal when it hits the ground as it can change several times in transit. a flat dipole beam is horizontally polarized and it's signal will pretty much stay that way regarding a ground wave contact. when it hits the ionosphere, it may be subject to "ducting" which, again, if you could "see" it, it will look, simply speaking, like it's bouncing around inside an air conditioning duct. this can change the signal as to wether it's sine wave is moving up and down or from side to side.
ON AVERAGE, the skip distance is about 2500 miles from transmitting antenna to receiving antenna on a single bounce.
if the ionosphere and earth cooperate, there are often multiple skips where the signal will bounce from earth to sky back to earth and back to sky several times hence 5,000 or 10,000 mile contacts.
mind you, i've yet to "see" a radio signal but this is the way the theory goes. :)

BEFORE i get blasted by the RF police, (if they read this far before they start shooting),these are very simplistic terms that are ment to bring a mental picture of what's happening to a radio signal as it goes from point A to point B after it passes through customs. this doesn't have, nor does it need, all of the technical why's and where for's for the purposes of this discussion.

i hope this helps.

jeff

with all of the changes that you'll be making to convert it to 27 mhz, you'll
be changing almost every major part in the radio.
unless you're a die hard hobbyest with a lot of time on your hands, it isn't
worth the trouble.
good luck

check to see if ic 6 or 7 have pins bridged.

thanks I checked and they are not. What I did notice is that there is a light
green wire that looks like it was cut from where it enters board saying
am-tx-sw and jumped to pot vr-803. also looks like from solder spot that there
was a wire either stock or jumped to right below vr803 marked am that there is
no longer a wire there.
any ideas
thanks

you CAN convert a car audio amp to supply more RF power for your cb and i'll tell you how:

1) gut the audio amp and toss the circuit board.

2) find a linear amp that has a similarally sized and shaped board.

3) install said board into the heat sinked case of the audio amp paying special attention to good heat sink, grounding and ventelation practices.

4) install all of the proper antenna plugs and provisions for power and make all associated connections from said plugs to the proper places on the board.

5) VIOLA!!! 1 cb amp that resembles a car audio amp.

i guess my pain medication is getting to me. :)
have a good day.
jeff

These pages descibe "conjugate coupling" (found in very first sentence) which is equivalent to using a transmatch. He is retuning the transmitter output circuitry to perform the function normally done in a transmatch.

For conjugate coupling, the impedance seen looking into the transmitter (or transmitter/transmatch combination) must be the complex conjugate

(R+jX versus R-jX) of the impedance seen looking into the input of the feedline.

When I left the hobbie some twenty four years ago, a license was required from the FCC and they gave you some god-awful call sign. Now that I'm back, I hear people using call signs now on ssb. Is there an informal association providing this kind of service?

Or is it up to the users imagination to pick one of his own fancy?

What is the current state of the air?

An easy solution which l have done before is use a general receiver with a set of headphones . One person transmits on say channel 4 and receives on his other radio channel 25 .the other person transmits on channel 25 and receives on channel 4 . This works out soo cool and nobody knows what is going on . The neat thing is you both can keep transmitting at the same time , like talking on the phone ! Split frequency and drive your friends crazy !!!!

If anyone has any junk, damaged, parts missing Cobra 2000GTL base radios for sale I may be interested in them for parts. No certain part needed. I do not need speakers or mics. I just thought someone might have one that has been hit by lightening, in a fire or run over by a Mac Truck ect. It can be a unit that was used for a parts to begin with as well. (some parts missing is fine) If you have any that fit this description drop me an email and we can discuss turning your junk into cash. Did you find one at the bottom of a lake?? Does your dog chew on one for a toy in the back yard? E-mail me and we can talk.   I am not looking for any working units unless you want to let them go real cheap. If I buy any working ones, they won't be for long!

I see Carl is selling one but it looks like he wants to sell all items at one price. I don't want the other things he has but they would be nice for someone! If someone buys his stuff and doesn't want the 2000 drop me a line!

Thanks!
Mike

I have many times, while on the phone with Becky, offered to do the site for them but there was no interest. I know Sam paid some asshole way too much money for what he had done the first time around and the friggin e-mail links didn't even work! Sam needs to get his act together on the net or it will VERY quickly pass him by. I know Charlie had a site on Angelfire (I think it was Angelfire) last year but without his own domain, who is going to remember the Angelfire/blah_blah URL? If the wholesalers get their collective acts together it would make for much easier price checking. Not sure myself as to Lesco having a site but it would be in their best interest to get one up and running also if not already done.

You can throw a cat four doors down the street?? Man, either you guys

must live close together or you can really throw. If you spent more
time throwing a football, instead of a dead cat, you'd really be in the
money. ;-)

> HI EVERONE, HOW WOULD YOU COMPARE THESE 2 RADIOS

I've had both in the past. Both are fine radios, but I guess one has to choose one over the other. So...

The 2510 is a sweet little radio, especially with the chipswitch added. The controls are well laid out, but a little small. And the output quality is excellent (especially with a good microphone). I also like the overall appearance. The 2510 is a good radio to use in the house.

The 2950 has some features that are interesting, but seems poorly made

(I had minor solder connection problems with two out of two radios).
The display is nice. I didn't like the knob layout, but the knobs are bigger with wider spaces in between. Considering the display and larger knobs, the 2950 is a better radio to use in a vehicle.

However, if I had to pick only one, I would get the 2510.

>
> Or is it up to the users imagination to pick one of his own fancy?

Most people just pick a few numbers that sound good to them. Some use a variation of an old FCC callsign. Some use the first three digits of their zip code, or the phone area code in their area. And some groups issue callsigns to their members.

None of these callsigns are official, or regulated, in any way. And I don't know of anybody who tracks them on a widespread basis.

system).

The propane flame evaporates the ammonia in that system. At least that's
how camper fridges work.

Robert: Propane is one of the chemicals. Butane is another. Check out
http://www.epatest.com if you are interested in learning more about
car AC's.

Yes,

I was in Lancaster for my Jr. High years...

Like the big building they built for the Space Shuttle on your little base?

My grandfather was one of the first people to ever set foot in that building.

He was also on the U-2 and SR project. Worked at Lockheed in the large complex in Palmdale.

I have a live flight jacket from the SR-71 from the 70s....

Mach ???+ and higher!

We lost windows at Park View Middle School at least once a month.

Typical response....

"Umm, I don't understand the question, and I am sure that deep down inside,
I am wrong, so I guess that I will just use some profanity and counteract my
$60K education"

"And then, since I sometimes forget what I have said, and am tired of
looking like a liar, I will always tell everyone what I said 'Prozac said
that'... Yep, then I will be able to go back and read what I have already
said and people won't be able to contradict me because I contradict myself"

haha

The easiest way to work one of those it to do one of two things:

1. Use a MB8719 chassis to work as the RX section. Then, all you have to do is put a simple relay in the Johnson and use a diode switch circuit in the 89719 chassis radio on the MB3756 to turn off the RX voltages when keying the Johnson.

2. Do what a lot of the bigstrappers do (including Prime Minister)... Disable the VFO, run a CB radio into the VFO input and viola... You have the stability of the CB radios PLL along with the plate modulated sound of the Viking!

> All it takes is someone with a few bucks and they can have one. he has
made
> several fet amps. Offering them for sale to the cb community would be
> useless.
```

Why?

Because you don't understand them?

For starters cost is a major factor

Oh BS. Cost of some FETs useable on CB is cheaper than the equivelant assortment of 2879s needed for that power level, you don't need to match FET devices like you have to with bipolars and FETs can be paralleled for more output!

Yep, they shouldn't be used!

and they are not allowed in the
> keydowns

Not totally true. 28 volt and higher devices are not allowed in any class BUT the sky classes, and they get beat, too! However, a 12 volt FET is completely legal!

If you tried to get into a sky class with them people would cry and
> complain that they are not allowed.

If you tried to get into a SKY class, where the only rule is that their isn't any rules people would cry foul? On what basis...

"Umm.. Excuse me.. I just shoved my foot square up in my oral orifice again... Please forgive me while I pull it out.... Prozac said that!"

tnom, thanks for the heads up on yet another attempt at government to control it's citizenry. Should this assault on the First Amendment stand, we can all be certain that it will snowball into other groups faster than you can say CQDX...

To the poster (I can't reproduce your ID, you must be related to The Artist or something :)) who said who gives a s**t about skiing in this newsgroup:

If you had read the article, you would have seen that the order by the Judge was issued to end an extensive "flame war" that had been continuing on the NG for six months.

Sound familiar?

Just for the record, I am a longtime CB enthusiast. I also ski.

Phil

Windows 98 is looking pretty good for y2k. But I agree you have to get the updates from microsoft site. There is a second win98 cd out (incase you didnt know) that is for y2k. You can get most of what is on the second cd on the microsoft site for the y2k updates. But not all of them. I dont think

you have to worry thou. Only people that will be affected by y2k are the
little companies that dont think they have to update there software and
hardware to be y2k compliant. I get a kick out of these people stocking up
on food among other things. They think its the end of the world.

Hey John,

  Picture this scenario:

1. You know absolutely nothing about electronics, HF theory, computers, etc.
2. At best you only know how to shut down windows, and start/close programs.
3. Your uncle has a CB that bleeds over, and has some means of finding out
   what you are saying, or is just messing with you.

In other words, perhaps giving a person one opportunity to tell you what they HONESTLY believe based on the above circumstances isn't really that bad of a thing. Thing is, when you DONT give that opportunity, then all of those that ARE serious about the hobby dont wish to post, and therefore learn, and get this, therefore you'll find yourself with a dying hobby. I believe there are ENOUGH of people out there that would like to see CB die. Oh well. I could go on and on and on and on. I could even ask a rhetorical question or two such as asking whether or not you were born with a CB microphone in your hand. But, why? As I said, it would be a rhetorical question and therefore sarcastic. Blah, blah, blah.....

Hank

Hey Tim,

Thanks a lot. I had no idea they all used the same prefix system. I
downloaded that list. That will come in very handy. Thanks again.

Buck

I own and/or have tested over twenty models of FRS HTs.

The BEST are...<drum roll, please>

Well, if it's sheer simplicity of use - get a pair of the Vertex VFX-10 HTs. Under a hundred bucks each. Full power output. All 14 channels (weather channel reception, too). Simple to operate: just two knobs, ON/OFF/Volume, and a chennel selector. Couldn't be easier. Can NOT be out-performed by ANY other FRS HT. Has DCS encoding if you find all available channels busy in your region.

If it's full-features you want (LCD display...audio inversion speech scrambling, et al) then the original Kenwoods are now about 70 bucks each. Although "only" 300mW out, you will never know they do not have the full FRS legal output.

There are many bargain basement models out there - and, as in life, you usually get what you pay for. Radio Shack hasn't produced a unit with good case material yet. The cheapies at discount stores for fifty bucks a pair are, in my opinion, not worth playing with.

My choices have been Kenwood and Vertex for a couple years now ... both quality products from reputable manufacturers.

I checked my match and it is way down around 1:2 or 1:3. I've made sure the attenuation switch is at full. The first notch doesn't even cut out much, maybe 2 pounds. That switch might be a bit dirty maybe, but all the switches seem to be working good. Anyone else have any ideas?

BTW, analogue dual dials on this rig.

Congratulations for going after your ticket, and yes it will make an
excellent Classic CW and AM Phone rig, with 10 meters opening up there
is lots of AM activity around 29 mHz.

Thats abunch a bull*())_) I owned my own shop selling Satellite cband systems and installing them for years and the one thing that I always said was good info is free and
is good karma. work is money.
I have given lots of info {whitch is all I am asking fo} to lots of people on the NGroups
and never blinked an eye. You must be some cheap bastard that you want a few bucks for typing a reply with your hands.
The good thing is people like you are few and far between. If I was asking someone to fix it I would pay, But for some quick info I belive that is one of the reasons the groups are here.

So go back and take your cheap ass bitch self to FreeI.net cause thats were the freebie netters go and stick your cheap ass bad karma attitude were the sun dont shine......... Thats some free advice cheap ass!!!!!

Hey Spiker,

If you are considering getting into the CB World, this bulletin board is just an initiation, and the real CB World will be worse at times. It can be rewarding too. If you can cope with the idiots of the world, you will enjoy CB, if not, do not waste your money. You will find the idiots in any field or hobby. With a medium like CB, you will be exposed to many people at once, and maybe several of them will be dips. Take them with a grain of salt, and you will enjoy it. It is not always like this.

Amen. Excellant advice. Sooner or later something always seems to happen to them to stop them. It works real well, but for the most part, the best method is to ignore. They do it for attention, and if everyone, with no exception, just treated them like they had no effect, they soon go away.

Once he is located, you can enforce with the local police. Search the FCC code
for the statue on local enforcement, and with enough push from you, you can get
results.

Actually if this device is the one I am thinking of, it measures the signal strength at each antenna, and deciphers which antenna is receiving the strongest. As long as the signal is stronger on the front antenna, the green LED is lit. If not, the red LED is lit. Works really well.

I tried this one, only modifed for CB, built by a guy known as Swamp Fox in Salt Lake. It requires that you use two mag mount antennas, that are identical, one on the hood and one on the trunk. They must be at least 9ft apart. Works real well.

This is an excellant method, I wish I had thought of it several years ago.
Real ingenius. Be sure and take the bolt cutters and baseball bat with you.

Just use your CB. Mount a magnetic antenna to the center of the roof. Keep
turning down the RF gain until you are real close, then unhook the coax if the
power is too great. I can find any base in little time. With the antenna in
the middle of the roof, you can tell when you are perpendicular to the signal

when you hit the point of null. It will be a small, sudden drop in the signal
just as you pass it. The signal will either be to the right or to the left.
If you turn left, and the signal starts falling off, turn arosimiliar than you
think. I did it for years.

You may laugh at this one, but once I moved an old washer out on the back porch, and when I put the mobile antenna on it, it worked like a dream. Another idea that works is to get an old washtub, turn it upside down, mount a k4a Firestick to the bottom, and mount the antenna to the middle of the tub. I have used a shopping cart, a washtub, a freezer in the garage, a propane tank (Stupid idea) and several other things. Be open to most any mass of metal. I once even left the mobile on the car in the driveway, and ran a new coax from it to the base indoors. I disconnected the coax each day to drive the car. When you want to talk, there is a way. I think that if I were you, I would use old coax, and run an inverted V. I did this inside the living room from the ceiling, and it was by far the best.

Yes, they are telling people this, but I know people on the inside. This is the strategy. Barjan wants to capitalize on the name and reputation Wilson has built, but the actual plan is different. Mark my words, and watch the future. Barjan does this with a lot of the items they carry. They are sold in most Truck Stops accross the country. Ask any truck driver what they think of the quality of Barjan products, and ask them the history of past products that Barjan absorbed. The proof will be in the results the next year brings.

Actually, I studied AC/Refrigeration for 3 years in high school. I know the history behind it. First, there was brine, you know, salt water! Propane and butane were used in the early days in refrigeration. Refrigeration was much more important than air conditioning in the early days. I don't think you'd want to use either in a vehicle. You can imagine what might happen in a front end fender bender with a spark.

Yes, to someone who wants to OPERATE a station.

The Johnson needs a separate receiver, which in turn means someone has to either go to the expense of getting a radio that they will modify to kill the RX section when the Johnson goes into TX mode, or get a real RX radio.

They also need to learn how to properly tune a transmitter (tube rig), and someone nearby needs to know how to fix the thing if it ever breaks.

I am not trying to scare you, just let you know what is really going on with it.

They do talk, though... God, do they ever talk!

Did Johnson make a matching receiver? As for having someone nearby to fix it if
it broke, I know a couple of people who might know how, If not how do you
recommend Buzz Brothers?... There prices seem a little high though.

On most CB's - yes. On most Ham radios, no.
On CB's with the mod limiter clipped - no.
But they offer something I desire more than "volume" (loudness). Different
```

amplified microphones and their audio characteristics modify the tonal
quality of the cb and that's why I use 'em.

You need to sell your house and move into a half a million dollar house to be on top of a hill and then you will have it going on.

1. Altitude
2. Amplitude
3. Attitude.

Those are the 3 most important factors in running a CB station.

Yes, i have one of the Midland 75-510 XLM FRS radios, the one that was dis-continued because of pressure from the FCC because it has a small magnet mount antenna, removeable antennas being of course forbidden.

The FRS radios are citizens band and FM only with a maximum of 14 channels covering 462 thru 467 mhz. The better radios feature an option known as CTCSS codes, which are a series of 38 sub audiable audio tones that allow a radios squelch to open only for another radio set to the same code. This cuts down on receiving unwanted transmissions from others. Max power is 500 milliwatts, and the better radios have voice operated transmitt capabillities that allow hands free full operation. As with anything, some radios perform better than others, but all of them are very usable. So decide what features you need, pick your price point, and have at it.

Have large box of old amplified micraphones. Turners (base and mobile),
D-104s (Base), Johnson, Sure, Cobra, some other non amplified mics in
box also. Been in storage 20+ yrs. Not tested but stored without
batteries! All boards look complete. Good shape except D-104s
tarnished. No water damage just age. 78 mics. Amplified mics $25.00
non-amplified
$8.00. Whole box $300.00 plus shipping from 92025. COD add 6.00 per
shipment.Money orders only.

11 D-104s, 26 amp. mobile Turners, 15 turner base (amp. sidekicks), 5
cobra amp mobiles, 21 non-amp assorted mics.

thanks for reading

Well I thank you for your input, I'm currently learning morse code and going for my Tech license soon. Then why morse code you ask? I plan to move past Tech and further up the line. There is no reason why I should not begin purchasing my radios now as opposed to later :) With CW as a mode of operation this would make an excellent Classic CW rig... wouldn't you agree?

Thanks as always,
john

Angelina and Giuseppi were standing before the judge in divorce court.

Angelina says: "Your honor, we benna marry 25 years ana Giuseppi he'sa always picka his nose ana when we maka love he'sa never letsa me on top. I just canna taka anymore."

The judge listens solemnly then addresses Giuseppi. "Giuseppi, isa dis true. You always a picka your nose and you never let Angelina on top? What you gotta say yourself?"

Giuseppi says, "Well your honor, itsa true. I picka my nose a lot and, yeah, Angelina, I tella her she'sa gotta be on da bottom. Itsa all go'sa back to when I'ma young boy. My poppa, he'sa very smart man. I always follow ev'ry ting he say. My poppa one day he says, Giuseppi, I gotta tella you da two main secrets ofa hava successful life."

"Number one, you always keepa your nose clean. Ana number two, never screw up."

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN........

Don't chop this radio up. There are no parts available for it. If the processor chip gets destroyed you can throw it away. We can't get chips for the ranger 2970 either. Unless you know someone who has them stock piled in the US. The 5010 is a fine radio. Take good care of it. Talk back "telk back" serves no useful purpose if your not using echo. If your radio fails to audio through the antenna, your talk back will not tell you that. If you are just wanting to get the correct response to your questions then talk back can be handy. You will always hear the right answer.

Good luck and God Bless
Debbie

__________snipped____________

[After rereading Reflections I have concluded that without the
use
[of a tuner the reflected power does not return to the finals where
it
[dissipates as heat.
....Ok let's run with this for a bit.

[Rather it just subtracts from the original power
[coming from the finals. In effect this power is never generated at
[all. I believe Bill Nelson has been saying this from the beginning?
....I don't know if he has been saying that at this point because I
couldn't follow this thread that closely.
....Let me ask, where does this recombination / cancelation take
place? Output stage?Final?Coax?   Antenna?
....If it was never generated at all then how is it we're able to
measure it and why do we strive to eliminate it?

[Use of a tuner will facilitate complete re reflection as I think
we
[all agree on. So that the only losses in this scenario are the coax
[attenuation losses for each trip made down the coax.

....What do you suppose is the mechanism for this re-reflection?
....Do you suppose it could be that this supposedly canceled
reflected power is momentarily stored in the values of +/-j the
tuner affords thru coil and cap combinations which serve to change
the phase of this energy to coincide with that of the incident
power.

[The heat that is generated in the finals with a mismatch is
caused by
[an inefficient operation, not by reflected power dissipating.
....Ok, you're on the right track with that last statement. Now you
need to ask yourself this, where does that inefficiency come from?
What is the mechanism that creates this inefficiency?
....Would it not be safe to assume that the mechanism that
dissipates this reflected power creates the inefficiency thru the
act of dissipating that power?

I have a Ranger and its a awsome am radio. Toll is right about needing a
tech near by. I have Johnson tech about a hour drive from me so Im lucky,
it could get exspensive sending a 70 lb boat ancor back and forth in the
mail when ever you have a problem. Also tubes are not very tolerant being
bumped around alot. As far as the recieve you can use a coaxial relay
switch with a exsternal speaker and another radio for recieve. Its pretty
easy to hook up.

oh yeah I forgot to mention that those co-axial relays are not cheap. A in exspensive one can run you around 90 bucks.

UWANAGO2 wrote:
>
> Is there any way to modify a relay switching mic. to be used with a CB. I have
> a old Turner model NC450C mic I would like to put to use.
```

The first thing you need to do is see if the impedance of the mic is compatable. CBs use low impedance mics (500 to 1000 ohms usually). The impedance will often be written on the mic. If not, you can measure the DC resistance across the mic element (assuming it's a non-amplified mic). If the mic's impedance doesn't match that of the radio there will be a mismatch. The larger the mismatch the weaker (less sensitive) the mic will be. In other words, if the mismatch is large, the radio will act like the mic gain is turned way down.

If the impedance checks out, the next thing to do is make sure there are enough switch contacts to do the job. Some of the old mics only have one or two sets of contacts. It takes 3 sets of contacts to work most of todays radios. If the mic only has one set of contacts, forget it--you can't use it unless you put another push-to-talk switch in it. If it has 2 sets of contacts you can use it with radios that don't require a ground-to-receive connection when the mic is unkeyed. Old relay-switched radios and RCI-2950s are like that. To see if your radio is like that, unplug the mic while the radio is receiving. If the receive audio is still there with the mic unplugged, two sets of contacts is all you'll need.

Now, if the impedance checks out and there are enough switch contacts, all you have to do is wire it up. You'll need to know what pins do what on your radio. In general, four connections are required: positive mic line, shield (which is a common ground and the negative mic line combined), a transmit line, and a receive line. If the mic is unamplified it's pretty easy to fugure out what does what. In many mics that were designed for relay switching only, one set of contacts connected together in order to make the relay switch. You'll have to change that because today's radios don't work that way. To make a modern radio transmit you have to ground the transmit line. To make them receive you have to ground the receive line. So, that is your objective. You have to set up the switch contacts so that the transmit line is grounded when the key is pressed, and the receive line is grounded when the key is released. Another set of contacts has to be set up to open the positive mic line in the receive mode. Once all that is done it's just a matter of wiring the mic plug to match the radio's mic socket.

I hope this helps.

     There's a short circuit board trace next to the delay
     capacitor.  Cutting that trace removes the delay.  Adding
     a switch to bridge the cut makes the delay switchable.

not if I buy it.... its a 10 mtr amp.... as far as I'm concerned its
homemade as I can't find a factory name on it anywhere it must have been
made in somebodys home....maybe from one of those kits. ya recon..\

think its all in how ya look at it.

jim <jimcar@erols.com> wrote in message news:38375282.387FDCB1@erols.com...
hey toll, i ran both (still with the jogunn 5+5 star) and with comparable field
elevation and lack of obstructions the pdl and the jogunn are very similar. the
difference i find is the jogunn has the better rejection on the sides. of course
there is a better forward gain with the jogunn but when conditions are moving
its not that big a deal. the jogunns are built extremely well (they stand up to
the salt air surrounding this island)
and the pdlII's problem is that damn copper wire that has to be just right.

73, jim, eastern long island ny

and that wire will be your demise if you live in an Ice Storm prone area....

First, lose the capital letters. Forget the coils. Don't cut them, don't spread them. Find a tech and spend @0-25 bucks before you ruin whatever you have spent already.

<><><><><><><><><><><><><><><><><><><><><><><><><><><><><>

I HAVE A QUESTION FOR ANYONE OUT THERE. ON COBRAS AND UNIDEN RADIOS TO GET MAX. MODULATION THAT YOU CLIP THE COPPER COIL THAT IS NEXT TO THE RF POWER POD. IS THIS RIGHT ???

THANKS

Good grief, so many DX clubs these days: Alpha Tango, Papa Wiskey, India Radio, Wiskey Wiskey, and the list goes on and on. And there's One Division, Section thirty-five, multiplication and division. Unless you're a member of one of these clubs you don't have a clue where they're calling from. Most of these sheep just give their call sign and no indication of where they're from. What is this, xenaphobia on CB? You only want to talk to people from your own club?

Well to paraphrase Groucho Marx, "I won't join any club that would have me as one of its members."

And while I'm ranting - what's with all these dxers, who the moment you hook up with them, are immediately asking for qsl info? Forget it buddy, I only qsl with people I actually talk to. Some of you guys are getting as bad as some of those hams who think an extended conversation is adding "qsl via the bureau" to their regular response of "You're 59".

Whatever happened to the good old days when people actually talked to each other?

Hello All:  Anybody run a stacked set of 5 or 7 element Yagi Beams?

How do you like em?

Look at the MaCo web site, they have a MBSK stacking assembly for the 3,
4, 5, 6, and 7 element Yage Beams. And all the other CB antennas they
sell which is a treasure of CB Antenna construction data.

http://www.majestic-comm.com/maco/support/index.htm

I heard a few of the boys on skip the other day talking about the
stacked 7 element beams. Thought it would be neat to install a set of 7
element Yagi Beams, or a set of PDL II's Quad beam antennas.
Any comments....

Jay  at  jay123a@qnet.com .... In the Great Mojave Desert, just down the
road ah ways from the fillin station.

Hi Folks:

Not certain this subject fits exactly in these groups, but I suspect folks who know scanners and cb radios would have an opinion here.

I was thinking of getting a pair of those FRS walkie-talkies, maybe for Christmas, just to tinker around with, car-to-car communications, around town or on hikes and walking, etc.

They would be smaller than CB radios and cheaper (in-range) than cell phones.

But I see a pretty wide variety of models out there, with various options; security codes, channel scan, etc. And I've never actually used one of the radios myself.

Any out there have any direct experience? Any opinions to offer on what to look for, or pricing?

Thanks!

- Dave

>town or on hikes and walking, etc.

The answer is: it depends.

Who are you going to talk to? If that someone is someone who is not familiar with radio equipment, then the most basis radio would be the one to get. A couple of channels at most. You don't need to get them confused with 14 channels and a gob of CTCSS tones and 12 buttons on the front of the radio.

I have a Radio Shack (some unknown model #) that I paid about $60 for, I think. It's pretty basic. I also have a Cobra MicroTalk3 that I paid about $70 for. It has everything -- *all* the CTCSS tones, channel scanning, tone scanning, vibrate, tone on/off, etc. It would probably confuse most people who haven't used scanners or other majorly complicated electronic equipment.

Some of the best information on FRS and GMRS can be found at
http://www.gmrsweb.com/gmrs.html
Take a surf over and I think we can answer most, if not all, of your FRS questions. Take care.

Regards,
Tony

Is this a decent radio for AM operation? I had owned a RG-99, but after talking on it for a while, it would heat up and start to squeal. Any other suggestions for a good mobile radio..I use a Predator 10K antenna, 213 coax, and the mount is grounded to the truck frame..Thank you for your advice.

alot of so-called techs get the NB/ANL out of whack when they align the rcvr. Have it re-aligned to spec's...you'll find it has a pretty good noise filter.

Uh Oh............. Someone Born in Brown Mateo.......
The he moved to San Bruno? Oh well at that age I'm
sure he didn't have to much say in the matter.

So what he is saying is don't worry about your antenna (thousand dollar max)...

You need to sell your house and move into a half a million dollar house to be on top of a hill and then you will have it going on.

1. Altitude
2. Amplitude
3. Attitude.

Those are the 3 most important factors in running a CB station.

Is there any way to modify a relay switching mic. to be used with a CB. I have
a old Turner model NC450C mic I would like to put to use.

NAS Miramar is gone!

They gave it to the Jarheads.

Then, they moved the Blue Angels to the middle of the desert....

So, I guess everything changes.

The people in Miramar thought it was bad having the NAS base their, what
with all the noise. So they moved it.

And let the Marines take it over!

Politics at it's best!

And if I told you that I was running all DaveMade in my mobile, but then had a large FET amplifier for the final, would you also question that?

Well, Dave doesn't make a FET box, so it would be impossible for me to even count that, wouldn't it?

Some people just don't use the mental capabilities they should have been given.

Good points. Maybe one strategy would be to buy a pair of the less expensive models to experiment with or to loan to others I would want to talk to who lack experience with transcievers, then maybe later upgrade to something with more options...but that would still be compatible with the simpler models?

Sounds reasonable?

After rereading Reflections I have concluded that without the use
of a tuner the reflected power does not return to the finals where it
dissipates as heat. Rather it just subtracts from the original power
coming from the finals. In effect this power is never generated at
all. I believe Bill Nelson has been saying this from the beginning?

Use of a tuner will facilitate complete re reflection as I think we
all agree on. So that the only losses in this scenario are the coax
attenuation losses for each trip made down the coax.

The heat that is generated in the finals with a mismatch is caused by
an inefficient operation, not by reflected power dissipating.

I just got a new Palomar 225 from LCR. I really like it but the delay on
AM will take a little getting use to. LCR shows a picture of the delay
capacitor on there site for a modification, but how do you modify it to
get rid of the delay on AM and still have it on SSB? Is it as simple as
clipping the capacitor? Thanks.

although i dont agree with you about the clubs i do agree about all the qsl nonsense. ive stopped qsling with anybody since before this cycle even started. its not worth it. all the groups you named all use the same prefix system(as does 99% of the 11 meter groups) its very easy to tell where some person is calling from. see this link for a complete prefix list. hope it helps.

That particular amp is mass produced and you know it.You may be able
to justify it to me and yourself and may have found a loophole in part
97 but you are certainly violating the intent by using an amp you know
was manufactured and sold ilegaly.I thought more of you.

Dave
I can always make special deals on certain tubes that I have in large quantities of tubes such as 6hf5,6dq5 ,30kd6, 36kd6 and other higher voltage tubes or qty of common tubes such as 6au6 ,50c5 ect lets talk.
Tubes such as 6lq6 6lf6 6kd6 6js6c are in high demand and I have a limited supply .People have to realize these tubes are not going to be around for ever and should rewire there amps with with higher voltage tubes such as 36kd6 ,30kd6 ,12jt6 ect. Tubes such as 8950s are virtually extinct .Yet many these of the amps can be rewired to 30kd6 35lr6 ect or drop the filament voltage to 6volts and use 6kd6 (a little less expensive than an 8950). There are good qty of 6jb6a & 6146 tubes around for the drake and kenwood radios.The yeasu ft101 is a different story 6js6c tubes are drying up fast yet there are mods available using different tubes such as a 6lb6 or maybe 23js6 & 31js6 tubes.Half the fun of being a ham ,cber or a electronic nut is experimenting with electronics. Unfortunately where not all elec. wizards and make boo boos .That is why we need techs like yourself around or dennis #12 (up here- in chicago) to resolve these problems.

happy holidays,Bob n9tew

I could be used on 10 meters legally, who cares if it is massed produced. How would someone buying it at a hamfest know if it is mass produced? How is one to know if it is mass produced or built illegally? What would be the differance if you built the exact same unit part for part. Could you use it then? Would it be the same as a mass produced unit.

After rereading Reflections I have concluded that without the use
of a tuner the reflected power does not return to the finals where it
dissipates as heat. Rather it just subtracts from the original power
coming from the finals. In effect this power is never generated at
all. I believe Bill Nelson has been saying this from the beginning?

Use of a tuner will facilitate complete re reflection as I think we
all agree on. So that the only losses in this scenario are the coax
attenuation losses for each trip made down the coax.

The heat that is generated in the finals with a mismatch is caused by an inefficient operation, not by reflected power dissipating.

P.S I must repost because I forgot something

An example........A scenario without the use of a tuner and a 3:1 match at the load. 25% of the original power reflects. The reflection upon reaching the transmitter in effect also sees a 3:1 match. At this point 75% of the reflected power subtracts from the original power. At the same time 25% of the reflected wave returns to the antenna where it again sees a 3:1 match. This process continues as it diminishes each trip.

So that instead of losing 25% of the power with a 3:1 match we only lose about 19% Again, not through dissipation in the finals but from subtraction. .25 x..75 = .1875 or 19%

A new more accurate chart should be used. Something like the one below.

1	0%
1.5	4%
2	10%
2.5	15%
3	19%
3.5	21%
4	23%
4.5	24%
5	25%

Greetings!

While most RF problems are caused by poor coax connections, I would like to know what you mean by, "not doing it all the time" - what are you doing when it does't cause this problem?

Driving? SWR from the antenna does change when wind forces the antenna to distort and change the SWR.

Lights on? Voltage low, so radio and amp don't run as efficiently.

Engine off? Same as lights on, but battery is constantly drained.

All the above can affect the power response the amp provides, and in turn, the problems with RF leaking into everywhere.

Grounding is important, but how it's grounded also makes a difference.

Care to elaborate?

While Dancing with the Mouse on Sat, 20 Nov 1999 09:32:24 -0500 (EST), the Modem interrupted with an MNI from "Limey007@webtv.net (Steve Rigby)", and the MotherBoard buffered this to Video RAM:

:+> I need help when Ikey up with my amp on it sets off my radardetector.
:+> intior lights. and my talkback gets real loud. It does not do it all the
:+> time. Irun a dx99 astorm 6 pill and flatline ant. Every thing is
:+> grounded Idont know what the problem can anybody help.

Greetings!

RCI-2950...

Pretty radio, lots of buttons, knob and their concentrics can be hard to fumble with while driving. Works good, takes mods well...programming it might be a chore at times but not bad.

President HR2510/Lincoln...

My personal favorite, but layout has small buttons, with controls in good places, only a little tight at times while driving. Smaller LCD display than the RCI and really doesn't have a real programming problems. More straightforward to use than the RCI-2950, but the RCI does have a few more bells and whistles to it. Lincoln model offers variable RF power, the HR2510 does not.

For Base? Both the Lincoln/HR2510 and RCI-2950 perform well. Problems with TVI? Then I'd stick with the President. The RCI looks good and is realtively easy to use, makes a nice Base.

If Mobile, I'd suggest the President.

Find or get the 49 wacki-talki.  Get one from a free country over there, IF
there is one!
Dave!!!

believe me, I have no idea what ur talking about....."brown matio ???" the
last time I visited there was in 1963 when I was discharged from the navy
and stationed at Treasure Island.....(under the Golden Gate)..

and we didn't move to San Bruno....lived there when I was born...was even
concieved there (i think)...   but the hospital was in San Matio.

Ok, so I see a lot of people here think a power mike isn't needed. Some say the engineers know how to make a radio better than the people who use them. Ok, that may be true, but this goes for all radio ops. Ham and CB alike. Do you think a power mike is needed?

My opinion.

I have heard plenty a stock mike, both on CB and Ham. I heard a $1900 dual band Radio on 2 meter FM a while back, and I think my ht soounder better, but when I was on 220, a fellow with a icom 220 base came on, and he put a d 104 on that baby, and I swore, I never heard a better sounding radio in my life. Pure

FM bliss. Ok, I agree, DON"T crank up that mike to the max people, if you want to sound your best, but there is nothing like an old Truner, D104 to make a radio sound it best! Just keep the gain at a safe level, not only to sound your best, but also to prevent channel splatter.

Hee hee!

Just make up your own. Find out your countrie's prefix, USA is 2, then add two
letters of your choice and then two or three numbers of your choice. That way
if you be talkin' to the real club members they'll know where you are calling
from before you tell 'em. For example,
2PP69, 2AA111, 2LK269
I think you get the drift. I don't believe in CB clubs - especially ones that
base their operations on illegal activities. Even though the cost is minimal,

the benefits are even more minimal. CB is anarchy - go with it!!!

MC is goin' home....

Greetings!

Good points to make tnom...

However, in the text I see the word "incident". It's a key to looking at the reflected versus forward power losses. Nothing is "automatic" when it comes to power level reduction. In these pages, he immediately discounts the efforts he places into the fact that the output network is *not* reflecting power.

To a point, he is correct, *summation* occurs, or the "incident" power is still the same. Where I draw the line, is when he used the word "Automatic" - HUH?

It is an interesting way of placing the concept of putting the cart before the horse.

In some minds this might be considered "negative reactance/impedance" - where power is gained. But I know that this is not the case. And I'm glad he makes that reference.

The word "incident" which I used another moniker, "summation".

This incident power would be fine if the Coax, Radio, and Antenna were fine. We still have line losses, and he does make references to this, but he continues to describe the "working formulas" as if these were superconductors, they simply are not.

I know you're not flaming, the reference you state does prove a point in regarding the reflection power working *with* forward to give you an overall *net* value.

Since impedance has changed, we've also changed the frequency response of the antennas own response and reactance to this now broader range of frequencies generated by the interaction of both reflected and forward power. We have an interference pattern being generated by the system.

Because it now has multiple reflections working with forward power.

This net value, if not dissapated, generates a gross value that over a period of time, these levels of power still accumulate to an overall value that can still work into the impedance output network and into the tank circuit.

In a single sentence, the radio responds to this by "I'm swamped".

Literally.

There is very little dissapation in line and antenna losses, except for heat from little ohmic losses and perhaps a harmonic or two the antenna and coax spur off, but even then, we're proving that the impedance change is occuring.

The fundamentals of the frequency and overall bandwidth of the antenna simply generates more of the problem and can cause runaway. Sure, some "R" is there, but this cannot totally remove all the incident power present.

So how is this overall net power removed?

This goes back to the pages of 44 and 45 in the reference, where Maxwell makes a stunning statement that knocked my socks off...

Where does the conclusion that this reflected power is never re-entered into the radio? Remember that the output is unbalanced. Otherwise the termination would occur there with a zero net result.

We'd never need a radiator.

Remember that inside the radio, the output network is looking for 50 ohms unbalanced on one end, but the final on other side is far lower - remember the bandwidth.

This doesn't mean that the network rejects this power, it's not, it's simply reverting it to a lower impedance that the tank circuit will have to compensate for, and this usually means into the final.

The ohmic values converted, are small, but if allowed to accumulate to a value, these can cause serious side effects. The bandwidth the tank circuit must provide, needs to exceed this value. And when SWR is low enough, this can occur.

It reasons to believe, that the transistor itself is designed to be operated at a lower given wattage, to accomodate extra bandwidth and power dissapation capacity or Safe Operation Area for a wide range of values presented to the impedance network and the output tank circuit.

Had this not been compensated for, the transistor would fail almost instantaneously.

This can be proven by simply running the radio without an antenna.

The impedance network itself is designed to reduce power when the load simply is not equal. How this is accomplished, is thru various means, and Maxwell dismounted on this.

Thats my irk.

How can someone dismiss the events causing the "automatic reduction of power"? Or the reduction of power from the radio, as "automatically" - this is a vague reference.

He's solving the problem, but the wrong way. The need to understand how the radio is responding to the mis-match is not "automatic" - there is no sensor, only the network. How the radio responds to the mis-match is thru the network. The reduction occurs when the output tank becomes swamped with a now different "R" value the matching network now senses.

There are two ways the R-value the output network can work, either reducing the impedance to a lower ohmic value, or raising the ohmic value - both accomplish the same task. However one lowers voltage, while the other increases current - between these two, the output of the final into the tank circuit and the load present on the other side, affects the power available by the final.

Since Voltage and Current at the tank are not at unity, dissapation occurs. The "automatic reduction of power" that Maxwell immediately notifes the reader. It kills the whole effect of what he's describing as "perfectly safe" to use antenna system with 3 to 5 SWR mis-matches - because of neglible loss.

This proves the point about how the radio "doesn't" see reflected power. I'm sorry, but it does, otherwise "reduction" would never occur and we'd have a lot of unhappy campers out there.

To have all the power "eventually" arrive to the load is a fault. No one seems to remember that the overall power summation problem has already been sensed by the internal circuits within the radios output network and power has appeared to be reduced.

That poor final, too bad it couldn't speak. It'd be screaming at us right now if could.

This power reduction, is proportional to the load and reactance sensed on the line by the network, and has already forced a power reduction. However, there is only so much power that can be reduced and still provide stable operation.

This is where the runaway occurs. And if allowed to continue, the output network fails to compensate and the final is left seeing a drastically different level of impedance than what it was designed for.

I'm sorry, but Maxwell needs to take some time and reconsider the reasons behind the power reduction due to the change in the load.

Everything is not "hunky dory" and full of roses, remember that roses have thorns, to say what he does about transmitter power reduction is "automatically" done at the radio is a real bonquet!

Because of changes in the reactive load, and the overall R value of everything included, the radio can work into something above the low impedance of the tank circuit, and less than infinity. Bandwidth is an important factor here. If we had an ideal amplifier, we'd have everything linear from DC to EHF, but we don't.

The power reduction effort Maxwell refers to, is due to the mis-match that causes the radio to reduce it's forward working power. Not simply by resistance, or impedance, it sees in the load. It's "seen" by the output networks ability to change the impedance of the tank circuits own response to the network. A feedback which affects power delivery by the final, due to the output networks own response to the change in the load.

If the output network was "totally reflecting incident power" the final would never see any true power change, and would still deliver full power and we'd have the runaway effect of damage caused by it. In fact it can, but once the level of voltage and current are met, it can't go any higher due to the final only has so much push into the network from the Tank circuit. When "incident" voltage or current rises, the overall net effect of the finals' ability to deliver into the load is reciprocal - there is less and less room for overhead, or bandwidth.

> It's interesting to note what junctions fail when a final "fails" due to high SWR. The power is reduced, but the junctions that are affected are pairs related to Base in cases I've found blown finals in.
>
> Why? Due to the base region driven by the driver, exceeding the RF power levels present at the collector, and *wham* the PN junction erupts and is punctured, the dead short, or the Base pumping power into the emitter, exceeds the surge limit because of collector voltage, and a fuse goes.

Why?

Remember that "incident power" reference. This tends to act as a catalyst in making such references, but not really giving us that understanding of what the radio is attempting to do.

"Automatic Power Reduction", This is simply not the case. A change of impedance at the Tank circuit of even .4 ohms, would have a dramatic effect on power in both voltage and current the network sees, and subsequently, Maxwells observation that "Power is automatically reduced due the output network of the radio sensing a different Zl".

Sure, the radio can produce full power, and if the impedances are not equal, we do suffer a loss as an increase in reflected power. Simple mis-matched load. A weak or low voltage battery, powering a higher voltage lamp, you get a dim filament with lower resistance across the filament - makes a good analogy.

To re-coup that power, is thru reflected energy, this settles fine...

... but to say power is automatically reduced? I need clarity on this.

The power potentials that the final must deliver into, have changed the response curve of the final. An SOA parameter, if a radio is properly designed, a 30:1 SWR can be tolerated indefinitely.

Can't guarantee power, but it will last a long time.

I wish these "black -Comedy- Boxes" were that simple to understand.

I'd like to know how to define "Automatic" without agreeing that the radio is receiving reflected power to adjust the forward drive level accordingly. Something is coming back down to the final.

The network is only the messenger.

While Dancing with the Mouse on 20 Nov 1999 15:36:23 -0600, the Modem interrupted with an MNI from "tnom@mucks.net", and the MotherBoard buffered this to Video RAM:

Greetings!

Although you do have a point, to arrive to a value without having to
change the power reading for calibrate, makes it easier for
first-timers and a general consensus of what the channels you do have,
have to say about the match they're in...;-)

In case of a well-tuned antenna, adjusting Calibrate is a waste of
time for each channel. The SWR meter can notify you once you have a
reference on one channel, about the condition the antenna system is
in.

Now, if you're really concerned, then yes, it's your radio.

But it's not necessary, and if you have to do it because of the change in Calibration power level on different channels, there may be a larger problem with unequal tuning of the radios TX side.

To get a reference, is simple. But the problems you suggest, can make the radio appear to need a good tune-up because more power is being used on the other side of the channels, than made equal across all the channels.

While Dancing with the Mouse on Sat, 20 Nov 1999 17:36:12 -0500, the Modem interrupted with an MNI from ""Scott (Unit 69)" <upplus@hotmail.com>", and the MotherBoard buffered this to Video RAM:

Hi all:

I have for sale some radio's and service manuals, to go with them. Or you can purchase the manuals separately. Following is the link, for those interested:
http://home.att.net/~j.dow-kb2tlb/home.html/radiocb.htm and for Photofax:

http://home.att.net/~j.dow-kb2tlb/home.html/phfact1.htm

tnx,
jim/kb2tlb

If you had the biggest amp in the world I would still think you are an ass hole so whats the difference?

And if I told you that I was running all DaveMade in my mobile, but then had a large FET amplifier for the final, would you also question that?

All it takes is someone with a few bucks and they can have one. he has made
several fet amps. Offering them for sale to the cb community would be
useless. For starters cost is a major factor and they are not allowed in the
keydowns If you tried to get into a sky class with them people would cry and
complain that they are not allowed.

I mention that point due to the fact that most radios have been fudged with
in some way. Not all techs are completely competent.

Actually Toll, the Angels are still out of Pensacola and practice out of El Centro. They lost the lead and the other solo a couple of months ago so they're out of commission this year. The reason they went from moving the NAVY out of Miramar was because of the F-14D's doing hi-speed take-offs at 3rd stage afterburners and breaking the sound barrier around the area. The Sound barrier corridor runs right over Jay in the Mojave but the Tail-Hooking Jet Schmucks do crap whenever and whereever they feel like it. Trust me. I'm in QA for our new up and coming F/A-18 Superbee and these F-14 transitioning pilots think they rule the world. F#@king assholes!!!

137... back out!

I have a Cobra 32XLR, I haven't seen very many of them, and was wondering if mine is worth keeping now. It has been channeled and still transmits and receives great, but the squelch control went out so you cant tune out the static. Is it worth trying to sell or should I junk it?

Thanks,

Jim Billings

Yes, a CB can be made to duplex. I have listened to the groups on 25 mhz doing just that for years. One radio, I think the Ranger 3300 could duplex. It is possible.

The trick with throwing a dead cat is to make sure he is still relatively fresh. I find that as the cat gets-well aged shall we say-the tail tends to separate when you spin it over you head. And yes, the houses are sort of close.

>Now that you know your radio is working, forget about it
>and concentrate on your antenna....

What about the antenna? It's a 102" whip on the back of my pick up truck. I hope your not going to suggest a 5/8ths vertical for my truck.

If I trust my swr meter on the front of my uniden, I'm getting 1.2:1 swr. Tuning it is going to be a challenge because it has a hard nob on the tip and something that looks like a bolt welded to the bottom.

Was wondering if it was illegal or not to inform people of radar traps and what not.. Would love to help people out like that when I get my CB but dont know if it is illegal to do or not. Also I plan on getting an amp for my cb. Was wondering if say I was to get pulled over and the BEAR seen the amp if I would get a ticket or something for it?

You cannot subtract power. It's one of those laws of physics; power
must be conserved.

You can, however, add and subtract voltages and currents.

> sees a 3:1 match.

Why would reflected power see a 3:1 match at the transmitter?
...is the transmitter impedance 16.66 ohms? ...or 150 ohms?
Why isn't the transmitter impedance 50 ohms?

> At this point 75% of the reflected power
> subtracts from the original power.

Again, power is always positive. It may travel in different directions
but it is always positive. Summing power will always give you more,
not less.

...when will their widespread modification be commonplace?

I have only seen one project, owned by an older gentleman
who frequents my local CB shop, that "behaves" similar to
a ham radio. I don't know what mods he did but it began
life as a "Unwired" FRS radio and now receives audio from
something like 440 to 500MHz and broadcasts on 440 to 475.
He said he knows how to make a power mod as well but battery
drain is an issue.

Questions...

1) Could this guy be telling the truth? He did add three buttons to the radio's display and I had him key it up on several different freqs and with my PRO26 handheld scanner with a magmount mobile antenna I was in fact able to hear the guy lima charlie on all the freqs he claimed he was on.

2) Will FRS go the way of CB with modifications galore, Linear Amplifiers, beam antennas, etc etc etc? Who has seen this starting to happen yet? Anyone?

A good tech wouldnt worry about sharing book knowledge with people. good techs make thier money on teck work. next time you need to the the spark plug gap think about what you would do without a chiltons manual. do you think if you called the dealer they would say pay me and i will tell you. no I think not becuase they are good techs and buisniness people The good thing is most good people techs, ect wouldnt make a comment like you do.
Have a nice day.

O yea I hope you dont open a shop with that attitude or you will go broke

No you can't get a ticket for telling people to slow down, and as for the amp wait a while and learn before you get it, it seems to me like your new to this and you WILL make mistakes... better you make a mistake and blow your finials then smoke your amp. If you are still going to get an amp keep it under the passenger seat out of sight if its small it will get fine ventilation under there. I had a boomer 600 under the seat and it worked great. I blew it up because I made a DUMB antenna mistake. If the cop sees it, "Why its an amp for my stereo, officer :)" More likely then not that will be the end of the conversation. There is a lot more info to know then this, but you'll get the general idea.
3 rules for an amp
1. LOW SWR below 1:1.5
2. NOT over 4 watts... unless its a high drive then under 10 for the average amp.
3. get a GOOD antenna wilson 1000 is the best in my opinion.

Lastly and MOST important when on the radio DON'T be an a$$hole.
Have fun with the radio,
    john(aka aardvark)
P.S. start stock then work your way up, think of a big radio as a race car... treat em fine and you'll talk for years but there very delicate and break a lot easier... a good stock on the other hand can take a hell of a beating an keep transmitting.

I always heard that to calculate the length of coax you used the following formula:

f = Frequency
VF = Velocity factor of the coax.

246/f = 1/4 Wavelength.

246/f * 2 = 1/2 Wavelength

((246/f) * VF) * 2 =1/2 Wavelength

Is all this correct? It seems to work real well.

Well I planned on only getting 100-200 watt amp. Not worried about messing it up. Im not going to be the one touching it. Have someone that is going to do it all for me. I pretty much want my cb for talking to people I know in town. But I would like to talk on skip every once in awhile. If I even get a radio good enough to do it lol..

I dont disagree with your input. when i had my shop i would even hand them the book on installing ect ect. the problem is on the groups if you go to any others you ask a question and you can get an answer, to not want to help your fellow man with some keyboard strokes is non american.
Im sure if asked most people do help.
Its alot different then walking in someones shop and asking to have something fixed for free.
you sound like you are an honest shop owner and your customer base is probably very happy.
All I wanted was direction on a easy question.

I'm brand new to the world of CBs..I just got a Midland 77-115 weather radio for my 4x4... I'd like to know if any of you know about its reputation..(i got it brand new for $65, was it worth it?) Also what kind of antenna is best and least expensive...i really like the look of the dual whips but are they functional? (need an alternative to magnet mount.(my blazer has a fiberglass roof) , and any info on increasing it's range...thanks in advance... I've looked on CB sites but they don't have much basic info for the newbie

k-bye,
Jonathan =AE

Sorry forgot to take out the html and pic. My bad. Used it to write someone a message then I cam here to post this and forgot all about it. For those of you who couldnt see it I asked how much a 100-200 watt amp would cost? Probably get it through Radio Shack. Looking for the cheapest I can get. Thanks...

Whats eveyones opinion on speech processors for use on radios like a
Cobra 2010 or a Texas Ranger 699wx. Do they do what they say they will
? or if not, what would be a good way to make a radio loud other that
peaking it.
Dave

I had those radios ten years ago, long before I had a ham license.
Today, I have a stock Cobra 2000 for CB use and a Yaesu FT-847 for ham use.

Oh look, its Mr. Tom Rowan. How are you doing? Got a quick question. You just started "hacking" didn't you? Bell Atlantic has been informed. Also, seeing that you used a Bell Atlantic IP to make this post, I will be forwarding all of this to my Attorney General, Personal Lawyer, Bell Atlantic and Consumer Affairs. If you wanted to know who I was, now you get to find out.

I consider this post of yours fraudulent and defaming my character. I suppose I will see you in court.

Hank

Just as a note to people on the group who care...

Svetlana has announced that they are dropping the 811A line of electron tubes.

They will continue to build the 572B, which will drop into the 811A socket. The 572B has long been a favorite tube for replacement, as it is rated higher than the 811A.

So, for all you people owning the Ameritron amps based on the 811A...
Sorry. Once again Ameritron has produced something that won't be supported in the years to come... (Ala AL600).

I use the top pole from fencing and it works well.  The life expectancy
won't be as long has a pole designed for a mast due to metal fatigue.
The wind will eventually bend it.  But I have seen antenna using the same
pole and are up for more than five years.

"Fun" is only a subjective opinion, which is why I didn't use the term. Aesthetic, seemed (to me) to be a better fit, as it describes something that is appreciated more for is "artsy" appeal, than actual practical application. I have no problem understanding the difference between CW "the mode" and the CW testing requirement.

The biggest problem is that the people on the "pro" CW side see any proposal for the reduction of the *code test*, as a signal that they might lose the ability to use *the mode*, so they vehemently uphold and adhere to the out-of-date requirements.

I would think that CW proponents would welcome further segregation of the testing. If CW proficiency were to become optional, rather than mandatory, then the people, who take the time and effort to learn and use CW, will be the ones who will fit in best with the people who are already there. Having something shoved down your throat does not foster the best attitude, and many may develop an "anti CW" attitude, because of all the pain they had to go through to learn something that they have no use for. This could lead to deliberate interference, or lack of respect for the users wishing to use CW.

People who like CW, and the nostalgia that it represents, should continue to use it, and should always have a place to use it. But that in itself, is no reason to continue to force everyone else, who are trying to move toward the 21st century, to learn something that is as archaic as the Titanic.

Actually, the FCC is in full agreement with reducing the code
requirement. It's the old fossils at the ARRL, and other "Keep CW at all
costs" groups that are fighting the trend.

>I think I have this straight--they and anyone who supports a continued
> morse testing element for HF access are wrong.

There is no modern reason to keep it as a requirement. Because YOU or others choose to LIKE it, is no reason to expect that everyone else has to like it too.

CW is a MODE, like SSB, AM, FM, SSTV, AMTOR, PACTOR, PACKET, FSTV, RTTY, QPSK, etc, are modes. There are no special testing dedicated to any of these modes, so why should CW be any different?

Maybe we should still require testing on the care and feeding of horses, when we take our driver's test......

"They". Who are "they"? If you are refering to the engineers behind HAARP, that hardly represents the conditions that CBers typically run under. HAARP has a very high gain antenna array,(along with a HUGE amount of transmitter power) with the acreage to boot. Something the typical CBer, even the "loud and proud" types can only dream about.

If I recall my HAARP information correctly, they were able to "heat" the ionosphere, which can cause some ionization, which will dissipate once the initial "heating" is removed. This also gave rise to a number of conspiracy theories, about the HAARP's real agenda, which was to control the weather.

In conclusion, while it may be possible for a special, very high power ERP station like the HAARP to "create" temporary ionospheric conditions which may support DX, it is still out of the reach for the type of equipment normally found on the CB band.

Nope! With the caveat that it cannot happen with "tuneups". If someone wants to take the time and expense to add the parts necessary, to accomplish this feat, then it can be done. But that is hardly cost effective.

```

I listen to 75 fairly regularly. While the behavior of these fine, upper class hams, leaves a little bit to be desired, they are not running noise toys, echo boxes, and other gimmicks. What they do have is a bad attitude. Most of the problems on 75 can be catergoized either as territorial in nature (This was OUR net frequency in 1955, and I'll be damned if I stop using it now!), or differences in opinion (Liberal, gay loving, democrats vs. God fearing, republican, christians).

The "ugly" side of CB, has people who jam other people, just for the sheer fun of it. Destroying other people's fun, is THEIR fun.

While I frown on bad behavior of any type on the radio, I can understand someone fighting to defend something that they believe in. But there is just no excuse for jamming for the hell of it.

> locked together. This way you can first stabilize your Tx given your particular radio and climate condition. Granted everyone will have to tuned their Tx to a net controller who is telling everyone that they are in sync. Then, everyone just tunes their Rx to any one of the particular radios in the group and it will be correct for the whole group.

But I can't believe that you can't see what a horrible pain in the butt, that this would be. It's so much easier to have one station transmit, and everyone else net in on him, than for everyone to play the "how's this, how about that" game back and forth with the "net controller", as they blindly move their TX freq. until it's on.

Perhaps the best system, would be to have the clarifiers synchronized, and everyone tunes in to the "net controller", then they press a button and the clarifier becomes an RIT only, for any personal "touch ups".

This is a gross exaggeration of what happens. It's very rare that the TX and RX sync is off THAT much (Unless the radios was "done up" by Billy-Bob, the local truck stop gas attendant and part time CB tech). Usually what is the case, is that some people use the clarifier as a "tone control", to adjust to their preference in a person's voice pitch. This will lead to a slight correction, but you are still far from unitelligible.

All it take is discipline. Discipline to NOT walk the clarifier the second someone sounds slightly off. I've been working SSB for many years this way, and have not had a real problem, except for newbies, and they learn fairly quickly.

At least back as far as the early 70's, if not much farther. I see one in my 1973 Lafayette catalog.

sheila wrote:
>
> HI EVERONE, HOW WOULD YOU COMPARE THESE 2 RADIOS

I have one of each. I like them both, but for different reasons.
Feature wise, the 2950 wins hands down. Memories, variable power,
greater frequency range, easier to read display.

Performance wise the 2510 wins. Better noise blanker, better adjacent
channel rejection, more power output, does not overload on strong
received signals, the "S" meter is better. Frequency stability is also
better.

Some of the 2950's problems, I have managed to correct, which make the
radio decent enough that I've used it mobile now for close to 7 years.

Hey Toll, Does anyone else have an 811A type tube? I've told people for
years not to invest into 6lf6 type sweep tubes and get an 811 setup. More
for less.

Hey Aardvark,  some of these guys don't have the knowledge and patience
required to operate a transmitter like a Johnson. They will, however, spend
lots of energy attacking your preferences.

Handy Andy or "Mr. CB" needs to chill and think about responding to posts that do not refer or pertain to him/her.

I read the post by "The CBer formerly known as Stealth Rider" (cool title)

And my views are very different.

His post was to let the others know that just because he is not on CB anymore -doesn't mean that he doesn't talk to them again.

And you need to look for your name in someone else's list -not his.

I believe that someone may have you on their list for bad-mouthing them and you [Handy "Mr. CB" Andy"] need to indeed grow up.

Making threats that if you saw your name on his list that you were gonna chew his emotional butt really do sound threatening. NOT!!

Also you need to go back to school and get a DECENT EDUCATION instead of listening to trash like yourself "dick-tasting" to others
about CB and how one is supposed to keep the fact to themself about having a ham license.

I saw a post that someone entitled "Handy Andy Is A True American"

FALSE!!

Nevertheless, YOU are A True Communist!!

You need to weigh the information and diversify with your "CB Nazi"-type attitude and Look at the BIG PICTURE!!
Yeah, Yeah -I know that you are probably going to be ready to type another useless "CB State of the Stupid" speech after reading
the truth about Human existence and how America will Walk all over your Nazi-buddies on CB.
Take a listen to "These Boots Are Made For Walkin'" and you and your CB-nazi buddies will be the subject of this song!!

America will not tolerate nor accept Communism as a way of life!

"So, Get Back! Get Back! Get Back To Where You Once Belonged!"

After reading your commentary response that was directed towards the other individual, I need to point to you a list of things to consider.

A> When you respond to a post, check your judgement towards the subject. DO make sure that it does NOT refer to YOU!
B> Respond to a post the way that YOU would want to have OTHERS who respond to YOUR posts!
C> Never instigate a posted message into a large-scale media event that WILL eventually come back on YOU!!
D> Make sure that YOU are NOT on someone else's list before you "chew them out"
E> Smile when YOU talk to others
F> Don't evend Respond to the post at all! YOU save yourself the humiliation and embarassment.
G> Accept the truth that YOU have just been humiliated and embarassed by "The CBer formerly known as "Stealth Rider"
H> Change your underwear the next time you attempt another stunt.
I> Accept the fact that other people use this newsgroup -NOT just YOURSELF.
J> Accept the only true knowledge of knowing you know nothing. (refer to the philosopher: Socrates)
K> Accept the truth that You Make Mistakes.
L> Learn
M>Never Assume - it makes an Ass out of yoU and ME!
N>Make sure that YOU are happy and content!
O>Just because someone has a Ham License doesn't mean that YOU should never have one!
P>Just because YOU know about CB doesn't mean to push your "religious beliefs unto them"

From A to Z!! Consider these, and you will never be a "Lonely CBer, again"

Now, what was that talk about telling others to what to do?
How is it that a person like yourself can't understand HAM radio?

I read the posts and was appalled at your reputation!
I thought you were a "True American" , Handy Andy aka "Mr. CB"
Nevertheless you are a True Communist posing as a "True American"!

Congratulations on becoming Mr. CB-ASS!!

Your title of "True American" has been given to "The CBer Formerly Known As "Stealth Rider"

After reading your posts and watching your weak attempts at cutting others down just because they were saying a farewell to those they know on CB.
You instigated the post and turned it into a repeat offender!

HOW DARE YOU!

Others use this newsgroup!

How about doing the same and Cease all Nazi-type activity or face prosecution for being a True Communist!

For one thing Ham Radio isn't about buying a $3000 radio and braggin about it!
That is your imagination because you don't understand Amateur Radio, yourself.

Hmmmm....so if I put my 50 Ohm antenna on a quarter wave of 50 Ohm coax I will have
12.5 Ohms at the radio? :->

> The main purpose of a balun is to balun currents in the antenna, thus preventing
> the coax from radiating from the outer shield.

Agreed. A balanced to unbalanced transistion.

```

I recently picked up a 4W GE handheld CB on sale for possible emergency communications use. I have no previous experience with this particular form of radio communications, though have extensively used other systems and frequencies.

I see a radio seller's page that gives the unit a range of "100 feet to 100 yards +" which seems incredibly short for 4 watts, even with a short handheld antenna. I mean, why bother? I can _yell_ better than that.

Is that range estimate in error? What is a _typical_ maximum useful range for a 4W handheld CB? I don't have anyone to test this out with, so I'm relying on the accumulated experience of users here.

Thanks for any help.

234/f = length of a quarter wave stick

300/f = wavelength; divide this by four to get your quarter wave (length in metres)

f = frequency in MHz

Don't forget that the actual quarter wave stick will be slightly less than a true 1/4 wavelength. This is to cancel the reactance such that it will provide a resistive load to your transmitter. In the case of a quarter wave sitting on the ground, this is 37.5 Ohms. Sitting atop a metal cone with sides 135 degress, it will be 50 Ohms (starduster). A coaxial dipole, basically one ground plane angled 180 degrees down (big stick) and you get 75 Ohms.

Can ya' digit?

I'm looking to buy older handheld-type, battery-operated calculators, mostly looking for the LED-type (or Nixie tube) calcs from the 1970s, the ones with the reddish, blackish screens, often with glowing red numbers, as opposed to those you see most often today, with their typically grayish LCD screens (except for HPs -- love em w/ any screen!). I'm looking for all makes, all models (and LED watches, too, if you have one), as long as they work well and are cosmetically clean -- see partial list below. (The only calcs I don't want are those made by Texas Instruments.) Anyway, if you've got the old manuals, cases, chargers, so much the better. Just drop me an email (floete@aol.com) and let me know what you have and the condition it's in, and what you might want for it, if you know.
Thanks!

Calcs I'm interested in include, but are not limitted to those made by: Hewlett Packard (all models, both LED and LCD), Adler, American, Apollo, Aries, Aristo, Brother, Busicom, Caltronic, Candle, Citizen, Colex, Columbia, Corvus, Crown, Dataking, Decimo, Dictaphone, Digicomp, Dixon, Edmund, Enterprex, Facit, General, GIC, Hanimex, Hermes, Iain Jones, Ibico, JC Penneys, Kingspoint, Litton, Logitech, MBO, MITS, Master, Melcor, Mintron, Monroe, Omron, Ordibel, Panasonic, Pico, Pye, Ragen, RBM, Regan, RFT, Ricoh, Royal, Samsung, Sanyo, Sinclair, Spectrum, Sperry, Summit, TKS, Toshiba, Universal Data, Verax, Victor.
Good golly -- can you believe there were once about 220 brand-names in all?

It sounds like an okay deal. I wouldn't pay more than 200 spondolies myself though - and this is assuming it is bone stock. Try it out. It's an old radio and will have all the problems that go along with that. If it is nostalgia you want, it'll give it to you.

Greetings!

You answered your own question, yes, it works well.

You *derate* it by the Velocity Factor of the coax.

Typical RG-58 - or RG-8/U use .66 or 66%.

Typical RG-8Xmini - is .80 or 80%.

But the values you're suggesting are rated for 66%.

If you use RG-8Xmini, you'll find it works, but you might not have enough length, it's shorter than what you need. So, don't forget to use VF of .80.

With any other type of coax, the VF may not always be available for it. So do a best guess, but I haven't seen any coax with a VF of 105% or something like that...;-)

Interesting topic!

While Dancing with the Mouse on 22 Nov 1999 06:43:03 GMT, the Modem interrupted with an MNI from "klhokanson@aol.com (KLHOKANSON)", and the MotherBoard buffered this to Video RAM:

Amen, brutha! In my vast experience in repairing CB radios of every shape, size, color and land of origin, the 'technicians' that aren't willing to share their knowledge are typically the ones that have the least amount of it. If you continue to learn as you work you will always be ahead of your competition regardless of how much you tell them. Of course, a fortune can be made from others' mistakes - and this IS good business!

Greetings!

You did fine, I've seen 77-115's cheaper, but only on the internet.

Don't give it too many bumps!

As far as antennas?

What part of the roof is fiberglass, all of it or just towards the rear past the center pillar?

A mag mount near the front of the roof is better than trying to run a dual antenna set-up - you get directional when mounted in an ideal spot, but having if off the mirrors right by the window pillars is shooting yourself in the foot for performance.

What other choices we're you looking into?

While Dancing with the Mouse on Mon, 22 Nov 1999 00:50:41 -0600 (CST),
the Modem interrupted with an MNI from "Jonathan421@webtv.net", and
the MotherBoard buffered this to Video RAM:

I'm a big fan of speech compression and processing.It will increase your "talk power" and make your signal easier to copy - particularly if your signal is weak or the conditions are noisy. Of course if you run them too loud they'll actually decrease your signal's intelligibility.

Dig

Greetings!

It sounds like whomever worked on it first, doesn't want to help you.

And I'm sure that by what you're describing, there are far bigger problems to solve once the "mods" have been undone.

This is what makes it difficult for others to provide help.

We know you're new, I don't have a problem with this. Others, as posted, do have a bit of a time trying to help when there is very little information to go on.

Saturn is from Galaxy, I suggest you start there. There are too many problems just from what I've read, to offer any direction except to bring the radio in to Galaxy and have them, *ulp*, rebuild it.

The 10Kc switch, sounds like a real problem. Same channel? It may be jumpered wrong.

Other things would be too involved.

I'm sorry to see that we can't help, but hopefully Galaxy can.

While Dancing with the Mouse on 21 Nov 1999 20:07:34 GMT, the Modem interrupted with an MNI from "iceshark@aol.com (ICE SHARK)", and the MotherBoard buffered this to Video RAM:

:+> of all the experts on this group no one can help me with how to modify channel
:+> expansion and clarifer and 10k sw on. come onnnn
:+>
:+> would be greatly appreciated
:+> thank you

Thats an old myth- you need gold plated PL-259 connectors to increase your
transmit range by 500 miles. A silver plated loading coil on your antenna is
worth a thousand miles! It helps launch the RF off the antenna using the mostly
mis-understood coilspring effect.

To the best of my knowledge, announcing the presence of police (PUBLIC
safety officers) on the highways is entirely legal.

I realize there are probably a couple jobs per state for CB techs and I appluad
them and bless you. For the other 99% of the people on the groups we are here
to buy sell, and swap information. so if you are depending on paying you rent
for the van you live in in the slums by selling your info.
GOOD LUCK.

Oh by the way I did get some good info on the Pipe for mast info if you need
it. seeing that you are almost broke....

Dont let that pot pie burn your flaming lipps

This is pretty close to what I had figured. After all, four watts is still four watts and it isn't going to evaporate in 300 unobstructed feet.

Thanks for the input.

That's about what I figured. Where they get this 100'-300' stuff, I can't imagine. That's mighty conservative for line-of-sight.

>If you are going to use it for emergency purposes get a 2-3 foot mag mount.

> Just go to rad shack and show them the handheld and they'll set you up
with the necessary
>connectors. (don't spend more than 30-35 bucks on the whole setup.)

Not when I spent $30 on the rig. 8-) Car emergency CBs with the longer mag-mount antennas show up on sale for around $35, so that would probably be more economic, plus it would have the advantage of being presumably SWR-pretuned for the supplied antenna.

Speaking of which, someone once told me that with a little junkbox circuitry you could do SWR tuning with a multimeter. True?

It might be fun to build a base antenna for it, just as an experiment and to put some of my garage trove of coax and connectors to use.

Thanks for the input!

Well if you use a capacitance hat on an antenna with a silverplated loading
coil it dampens the coilspring effect and cancels out any RF launching effect.
Them CB guys just like the look of the hat! Now on the other hand those neon
bulbs that light up really enhance the signal range. They step the 27MHZ signal
up into the .4 nanometer band (the wavelentgh of orange light) and launch the
signal at 3 times the speed of light. When combined with the silverplated
loading coil spring rate of 27185000 cycles it gives you about 20DB gain over a
trashcan lid! Now thats gettin out!

Jim

Ya' know, you could replace your 'scope, rf sig gen, freq counter, two-tone audio gen, function gen and dummy load with one ten-year-old IFR1200. That way you would only have to calibrate one piece of equipment each year. You -do- calibrate all of your instruments annually, right?. Hmmm...that doesn't look like an ESD workstation... 21 years? I think I'll do my own radios thanks...

Ooooh for Christ sakes John get the hell off your High horse, or soap box, or what ever. Maybe,
JUST MAYBE, the words didn't get typed out correctly. But from a stand point of him beeing new
to the radio he might of heard his uncle bleeding over his radio, and stephen might of talked
through his mike on his computer asking his uncle if he could hear him. At that exact same time,
his uncle talking to someone on the radio a, responded with the word "yes" and stephen
interpeted it as his uncle aswering him back. Not far fetched consisering I have heard two
stations having a conversation, and a local will try to cut into the qso and start thinking they
are talking to him, when in actuality they are not. You sit here and argue with

stephen just to
try to make yourself feel smart, and look as if you are smart to other people on
this newsgroup.
All you are acomplishing is making an ass of yourself. Now that I'm done with you.

Hank the only thing that people need to know is that DTI's program I believe only
works with
pll's that are BCD PLL's for the channel selction. But I could be wrong I havent
tried the
program.

You're lookin' at about 5 miles on the open road on a clear day. If you picked
up this radio strictly for emergencies, don't be disappointed if you can't raise
anyone when you need help the most. Also, don't be too shocked at what comes to
your aid! Myself, I wouldn't rely on CB for an emergency any more than I'd rely
on ten year old condoms for safe sex.....

Ribbit

Well, Well, Well !
I see that ONE has chosen to NOT read the post and conclude that it is too nice to accept so the ONE has chosen to act in a childish way by running off at the mouth.
How WELL Do You Know Those on the list below?
How WELL Do You Know Me?
How WELL Do YOU Know YOURSELF?

Ask yourself those questions before you send off another critique of a polite goodbye!
And, Smile to yourself when you provide the answer the way that you would want others to smile at you when they write back to you.

YOU can ONLY control YOU!!! Not Others!!

And by the way, I don't play your kind of games -I might WIN; and even if I don't beat you at your own game -I still walk away A WINNER, Every time :)

So, Do Yourself a favor, don't find anyone else to play your games.

I am referring to you "Handy Andy".

No, I am not bailing out!
And I chose to leave under my own accord, not others.

I have had weirdos, like yourself, get on the radio and cuss and run their mouth telling me to shut up --- I don't let others like YOU tell me what to do, when to do it and how. You Heard?

You Do NOT have the knowledge to tell me what to do!

Evidently you just wanted to hit the reply icon and started typing without really understanding the post.

Evidently you are NOT a real American as others claim!
Probably because you enjoy blasting other AMERICANS for the right to FREE SPEECH and CHOICES! Do these terms have ANY meaning to YOU?

I'll bet some of the human beings that I listed are composing a letter of their own to send to you as well. Then maybe not! You decide! I'm just gonna sit here and print out these posts that you send "trying to shake me up"   Yeah, whatever! As If!

Don't be foaming at the mouth about me talking about "my friends" behind their back.
You need to GROW UP and/or SHUT UP! Your choice!
Evidently you DO NOT know me at all!

Next time read a Dictionary, Thesaurus or another means of finding words that make sense.

Depends on when it was made.

Major differences:

Solid state balenced modulator circuit.
Jack and internal circuit for the external frequency counter option.
External ac outlet.
Revised VFO dial to indicate 40 channels.
Some small cosmetic items.

Feel free to Email me if you have other questions. I have a few
around and have been servicing them for many years.

cheers

I am already a HAM Operator!
You missed your "ultimate-warrior" chance to detour me away so relax and chill, you heard?

I am aware that your printer is active so you can print out the hardcopy later and read at your heart's content.

YOU do NOT have the knowledge to tell me that I insulted the friends that I made!

I did not BAIL OUT!
I CHOSE to leave under my own accord.

You STAY in school to get EDUCATED!
Then again you must be getting home-schooled on the CB! Yeah, whatever! As If!

I don't HAVE to keep the fact that I have a license of ANY type/class to myself!
YOU don't tell ME what to do!

"Appliance operator", huh?
yawn yeah, whatever!

Grow UP!

This may be the 90's and the end of the 90's is closing in, nevertheless, "Just because YOU got the Power -that don't mean YOU Got the Right" to tell others how to live in this decade!

I don't take crap, or kiss ass, or suck dick in the "workplace" or the in the "social arena" that these "GEN_Xers" have established!

I am an AMERICAN!
I Salute The American Flag!
I Spit on Communists like Marilyn Manson and Saddam Hussein!
I Salute to All Branches Of The Armed Forces!
I Welcome Visitors From Near And Afar in Peace To America!
I Love My Country! It's the Government That Needs To Wake Up!

I hope that sums it up for ya! IF it doesn't,
 "WELL, EXCUuuuussse.... MEEeeeee!!! !"

Ripsy, When did you e-mail them ???
Sunday It was I believe, Do you work 7 days a week? why not give them a
chance to get back to you during normal working days. Instead of saying they
don't answer there e-mails.

yes and if they go around telling everyone how to do there own job there won't be any tech work. You have to pay for a chiltons manual you brain fart just like you should pay for the info you want. Look on the front of engine compartment they have the spark gaps there . How do I know that from experiance, the same concept as what a technican has learned over the years . What happened to your shop ? give out to much free info the people didnt need you anymore Freeloading Loser.

Gunn is selling them for Dave and the price is $550.00 this should include
the driven element  "Which is the Rod"  and the reflector with its mount,
Perhaps you are somewhere that it isnt worthwhile  to  ship the 4- 12'
sections of aluminum cheap. And it may be cheaper to get your own elements
than to  pay the shipping for the 4-12'ers

Arent you the same fool who asked about using fence post for an antenna
If you owned your own shop I may go into business since I can see it doesnt take much intelligance to do so. So take your good karma and go freeload somewhere else and quit being so cheap and pay a tech for what he knows instead of trying to pry it out of people .

It all depends on the antenna. You might get a range of a 1-2 miles
with a 4 Watt handheld.I might be wrong, but I think that GE is just
trying to cover thier ass here.....

get a small antenna that you can stick on the roof of your car quickly
if you want increased range.

1) B&K 2040 with Eprom Kit and Digital readout for Export Radio Repair.
(3 bands of 50 channels) 5 - digit red LED readout. Looks awesome and is
calibrated to be perfect. Readout sits on top and matches with the 2040
Eprom Kit. No Holes in 2040, Readout is automatic for band selection.
$350 plus shipping.

2) 2 - B&K 1801 Frequency Counters. One works and is perfect
(Calibrated) and one is all there but parts only (will not count) $80.00
plus shipping.

3) Leader LSG-227 CB Test Center (Like the 2040 except Digital Readout, Has twin lit meters and all that stuff) NO -RF output , I think it is the 5 volt supply , Don't feel like fooling with it. Nice shape. $75.00 plus shipping.

http://home.mpinet.net/grassa

2040 and readout can be seen at this link as well as other stuff...

Bill

With the rubber ducky antenna that comes with it you will get about 3/4 - 1
mile in good conditions.
If you are going to use it for emergency purposes get a 2-3 foot mag mount.
I have the exact same setup, and she gets out very well with a two foot mag
on the roof of the Windstar. My tests show about 6 miles. Just go to rad
shack and show them the handheld and they'll set you up with the necessary
connectors. (don't spend more than 30-35 bucks on the whole setup.)  If you
really want to get out get a Wilson 1000 or 5000 with the (short load i
think is what it is called) then if you like it you can upgrade the radio.

How far can you throw it?

In all seriousness, CB frequencies require a long antenna. Any external antenna will help. Although a handheld's range is limited by the effectiveness of the antenna, from the third floor, on a quiet night, several miles is possible.

I have a Cherokee CM-10 with a Cobra CA75 power mic. I have a few questions about different things I've seen, and heard. First off I saw some type of filter for the receive end to cut the excess junk out. I can't find it again. Basically the manufacturer touted it as the way to reduce if not eliminate bleedover. Does anyone know what I referrring to? Some people have been complaining that I sound muffled, I listened to two people using my radio one male and one female and they both sound like they're talking through a muffler. Could this be the mic? Also on a similar note most of the people I hear sound the same. Is there a way to add a tone control? I have a print, but I have to get it enlarged so I can read it, it may be obvious to me then. Are there any pieces of electronics that improve the quality of my radio, no echo, no beep, and no noise toys. I hear good and bad things about everything I see. What's worth it?

===
Toll, when was the last time you priced fet's perhaps you can qoute me some
prices for fets comparable to the 2879. I also understand they can be
paralleled since this is what dv has showed me with some of his prototype's

>
> Yep, they shouldn't be used!

> completely legal!
===
As we all know there is not a set of rules for keydowns but try getting into
the sky class with them It may work the first time around but after that
they will ban them or guys won't run against you the word gets out quick
when new technology arises. It is just like the davemade rod of god, and his
voice chip after you whip them a few times they cry "No Mas" When after all
they can have the same thing you have. Most guys at keydowns are not
technicans and you could have the spec sheet on the 12 volt fets etc and
they still wouldnt go for it.

>

```
> If you tried to get into a SKY class, where the only rule is that their
> isn't any rules people would cry foul?  On what basis...
=======================================================
Maybe you can ask  BlueGill and Ghostrider this question they will not key
against anyone using the rod of god antenna in the sky class, what make
matters worse is the guys who wanted to use the big antenna against them are
running 2-3000's against there 2- 10,000  who is afraid of what here ? ,
then the big boys threaten to pull out if the keydown will allow them and
what happens then,  the people running the keydown don't want the $big
boys$$  leaving so they say no. I have  seen the same thing in dc sky . I
thought sky was just that sky!  Run what you brung!

Why would someone help you? You were very rude, didn't give enough information to go by. Try calling an auto parts store and try asking for the gap for a spark with the attitude you used addressing the NG and see what you get for an answer.

Just to let all those interested know; I tried the easiest remedy first, which was to simply move the antenna from the trunk lid to the middle of the roof.

Tada!!! Flat. 1.1 all the way across. Only drawback: with a 56" whip, this is a big-ass antenna! I have to take it off the car before it goes into the garage. But hey, small price to pay. The difference this antenna makes is amazing.

Can anyone tell me what to turn to adjust the freq. on the cobra 139? Mine is off frequency at the same level across the band. Thanks for the read! Jon.

Probably because I had an old 1971 J.C. Penny (if I recall) and sold it on
eBay for $360. I decided to auction once I saw others selling theirs for
big $$$$. I still have an old Sinclair and the Sinclair 2000 (in a box, Im
sure that is correct). I suppose these will go for bigger money some day
soon, if not already.

Hi Jonathan,

I too, drive a full-size (K-5) Blazer.What I did (and it KILLED me) was to drill FOUR holes in the left rear quarter-panel near the top, and put in a ball-mount. I then ran a Penetrater BIC-11 long shaft antenna on a quick-disconnect mount. It got out GREAT !!! No problem. But then, a guy at work talked me into putting a Wilson 1000 on the METAL part of the roof, between the driver and passenger. So...I did. The Wilson DID perform BETTER than the Penetrator, but now if I want to park in the garage, or the airport parking lot, I must first remove the Wilson. If I could do it all over again, I would have STAYED with the Penetrater antenna with the "quick-disconnect" antenna mount. The Wilson only did about 20 percent better. But of course, it was mounted in a better location. So, pick your poison...wipe off the tears, and whip-out the DRILL. You'll thank me in the long run. Been there, Done that!

HELP...(newbie here) I just bought a Midland 77-115 (seemed like a decent radio for $65 new.....?) and I need to buy an antenna for it. I'm using it in a 4x4 with a full removable fiberglass roof (Blazer).. I prefer the look of a pair, but they would have to be mounted on my mirrors or bumper... Where can I find something like these, and what kind would be best?? I heard there are drawbacks to using two antenna, is that true?? (remember this truck sees a lot of wheeling and low trees) Any help would be greatly appreciated....
thanks
P S (if that radio WAS a good deal, I can tell u all where to get one)

k-bye,
Jonathan �

Then why was I asking if Johnson made a matching receiver? I have a very nice scanner for 25-1300mHz 10m-23cm in fact I'm listening to it now. As for further down the band, the Johnson Viking II is, and only is, a transmitter. The receiver will be next.

Perhaps this is just my take on it, however I was under the impression that the bands it is capable of transmitting on was dependent on the VFO which I will be adding to the unit.

>

> A good, used, 80's era transceiver would be a better all around

I'm not an appliance operator, I derive much enjoyment "using" older tools,
they may be a little harder to operate, that doesn't bother me, the quality
of craftsmanship far surpasses that which we own today. I own an Allis
Chalmers B-112 garden tractor which was produced in the sixties and when
restored will eat a craftsman tractor and many others. As for all band
coverage please see above where I referred to a VFO.

>
> The Viking is a fine classic rig. But except as a CW nostalgia station

Practicality is derived from use, if I choose to use it and enjoy using it
then its practical. It has served many hams since 1953. Just because a
company released the biggest battiest newest thing doesn't make the
predecessors of that object junk... that only applies to computers.

Thanks for the response,
        john

95% of all D201A ever made are on a shelf somewhere 'cause you have to
continually work on 'em if you want to keep them goin'. Maybe that should
be 97%.

I would suspect, Huh, that the one you mention here
appears so new because it has been up there for a long time and has recently

been repaired to sell. Maybe not. If you buy it be prepared to get it fixed
on a regular basis IF YOU USE IT.

An' any Handy Andy is OK in my book......

Let me play Devil's advocate for a minute.

You do realize that is not impossible to get a zero reflected power.

All you'd need to do was match the antenna and run enough coax to waste the remaining reflected power in the cable dielectric and copper.

Or maybe find an isolator that would work at such low freqs.

Actually, I think the idea of reducing the code test requirement induces a jealous reaction on the pro-CW side. If the requirement was dropped, or even reduced, they would feel it is not fair - the new people are getting something that I didn't.

From what I have seen, they are already jealous of the no-code techs who get to use all those frequencies in the VHF+ bands, without taking the code test (remember the code test was required, to use any ham frequency, before the no-code license). So, from their perspective, getting rid of the code test would only be adding insult to existing injury.

However, lets face it, the code test is going to be dropped eventually. Ham radio is about the only radio service that still uses CW on a regular basis, and it is certainly the only radio service that is still tested for CW skill.

In the end, people will have to recognize that, whle CW was once a necessary part of radio communications, it is simply not needed in a modern world. Today, for military and commercial use, there are more efficient modes that offer even more reliable communications. That fact alone makes it rather difficult to continue to justify the need for testing of that mode in the ham bands.

Well, I'm sure mods will eventually start showing up. Some radios may be modable, and some won't.

Alinco for example makes some really nice compact 2M and 440UHF HAM HTs. They also make an FRS radio that looks awful similar.

While I don't know if you can mod the FRS radio to 'expand' it, I do know that you can mod the 440 radio to cover FRS.

But the problem here is how wide can you make the FRS go? And is it worth it?

If you 'expand' the FRS, chances are you'll just be able to expand into other public service areas, which WILL get you noticed pretty damn quick, and you will probably have a chance of getting caught that is orders of magnitude greater than being caught freebanding above 11M. Unless you are out in the country. But then, if you're out of the mainstream, why would you need to open up the coverage of your radio?

Although, I have to admit, being able to use your FRS to listen to other services is a neat idea. But 2 digit displays??? Come on!

Well, Dave, if you actually knew what you were talking about you might at least have a beginning of a point. But sicne you clearly don't we just have to dump you into the same category with Loose Lennie the Louse.
The proof will be found in comments to the FCC regarding the NPRM.

> already there.

What is totally lost in all this noise is the fact that CW supporters are ALSO digital mode supporters. How is that, you say? Well, for one thing many CW operagtors are also digital mode operagtors. And just wait until all the anticode yakkers flood the voice segments. The very next "I WANT" rant will be for expanded voice segments at the expense of the digital/CW segments. No question about it. When the fone bands are overloaded, there WILL be a movement downward, and flushed with the success of having just killed the code requirement, there'll be no holding them back.

If ham radio isn't dead it sure is seriously ill.

Having something shoved down your throat does not foster
> the best attitude, and many may develop an "anti CW" attitude, because
> of all the pain they had to go through to learn something that they have
> no use for.

Unhuh. Just as it alway was. The difference is that those childish folks you mentioned will NEVER learn what radiotelegraph as a mode actually is, they will only know what they percieve as unlearned individuals. Of course, today that's enough. Decision made.
And just who is it that is shoving ham radio down *anyone's* throat these days? I think he should be prosecuted.

This could lead to deliberate interference, or lack of
> respect for the users wishing to use CW.
>

Ah, so. Tacit admission that codehaters jam active CW hams, huh? No surprise, actually, and quite typical. I can't wait until the codefree HF license invites all the rest of the 27mc heros on down to HF ham radio. THAT is when the ARS can truly be declared as lifeless, and can be given a pauper's burial.

Welp, 27 mhz refugee that you are, you might at least make some attempt at accuracy. If you check the comments sent to FCC in response to the NPRm you'll see that some 75% of all writers support REDUCING the cocde test requirements. Including this "old fossil" writer.

>
>
> >I think I have this straight--they and anyone who supports a continued

No I don't think you have this straight at all. I don't see anything to indicate that you/ve ever had ANYTHING straight. Your qualification to make ANY statement about amateur radio licensing is nonexistant.

>

> these modes, so why should CW be any different?

Just because it IS different. It sure is no surprist that 27mhz illegal wouldn't know that much less understand it.

>
> Maybe we should still require testing on the care and feeding of horses,

well Tod I don't care what kind of tech you think I  am,  I know and thats
all that counts.... and I've been in the electronics repair business since
1972...  knowing what I know is my lively hood.  why should I give it away.
thats like doing estimates for free.   all the work is in the estimate.
wont take 5 minutes to change the part.   don't give them away either.....
so my answer to you is if you don't know enough about something to work on
it yourself, then take it to someone who does..

>induces a jealous reaction on the pro-CW side.

There are 2 distinct and different groups: *pro-CW* and *Pro-code-test*.

I am pro-CW and support *no* code test. There are many like me. Also there are many pro-CW operators who *do* support keeping the code test. If you're going to play the game you need to understand the players...

(And then there are the pro-CW operators who are *politically correct* and wish the code test reduced to 5 wpm, but not eliminated, right Ed??)

From my dictionary:

Aesthetic: relating to beauty.
Fun: something providing enjoyment.

Actually I didn't disagree with your word "aesthetic. I said that *I* would have used the word "fun" (because that's the way I perceive CW). But your word is also appropriate. Many of us do wax nostalgic about the grand old mode, as you would a beautiful piece of antique radio gear...

LESCO's site is promising, more so than the A1 site. But I'm still doubtful
about how well it will work. Even if they keep it updated, the online buyer
would miss out on the "brother-in-law" deals/prices you sometimes get from
the salesman (or saleswoman) while yakking with 'em on the phone.

Really? Prove your statement.

It's the old fossils at the ARRL, and other "Keep CW at all
> costs" groups that are fighting the trend.

False premise. The Board of directors and staff of the ARRL are old
fossils? They are in full agreement on keeping CW testing? Prove your
statement.

> >I think I have this straight--they and anyone who supports a continued

A "modern" reason? What, pray tell, is a "modern" reason? Because YOU

or others choose to DISLIKE learning morse is no reason to change the
rules or to expect the rest of us to dislike morse testing or CW use.

> CW is a MODE, like SSB, AM, FM, SSTV, AMTOR, PACTOR, PACKET, FSTV, RTTY,
> QPSK, etc, are modes. There are no special testing dedicated to any of
> these modes, so why should CW be any different?

Because a machine does all of the encoding/decoding for you in the
digital modes mentioned. None of those digital modes approach the
widespread use of CW. The voice modes aren't tested because an ability
to speak is assumed. Those who can't speak aren't likely to tie up
large hunks of spectrum using the voice modes.

> Maybe we should still require testing on the care and feeding of horses,
> when we take our driver's test......

You can start a campaign if you like.

CW is certainly more than a mode with nostalgia value. Many use it half of their operating time. Many others operate no other mode. We are, at least those of us who continue to breath, going into the 21st Century regardless of the outcome of the morse testing debate. Entering a new century does not call for us to change everything we do or to put on our Star Trek outfits and prepare to journey to the Mother Ship.

Recall that one wave length of transmission line is given by the expression:
984*1/freq. = wavelength

However this is not a true wave length for all transmission line. The above formula must be modified by the velocity factor VF in order to get the correct length. The new formula is: 984 (VF/freq.) = wave length.

You may ask what is this Velocity Factor: Hear is the answer. The speed of the signal in a transmission line is slower the a radio signal in free space. This leads to the velocity factor F (I call it VF not to be confused with Freq..) which is the ratio of the transmission in the transmission line VL and the transmission speed in free space VS.
This will give use VF = VL / VS. This number will vary from 0.6- 0.8

I have one...it's not the best. I wouldn't recommend it except on SSB. It
will talk AM, but doesn't sound very good.

Please note Before you jump up and down that the formula Klhokanson gave and the One I gave will come up with the same results. His formula is for a half wave length or wave length/2. As mine is for a full wave length or half wave length * 2.

I find my may easier to punch into the calculator.

>CW rig... wouldn't you agree?

Totally. Just wondering. Usually people get a receiver so they can listen to all those bands and modes they plan to eventually operate on. You seem to be exclusively interested in only the transmitter.

If you plan on working CW, the Viking is a poor choice. It doesn't have the WARC bands. QSY's will be laborious. Frequency stability will be less than optimal. Plus, you will be limited by the quality of the receiver you pair it with (selectivity, filtering, tuning accuracy, etc).

A good, used, 80's era transceiver would be a better all around choice for a new ham. You'll get digital accuracy, all band coverage, noise reduction and other conveniences you'll appreciate when on the air.

The Viking is a fine classic rig. But except as a CW nostalgia station

(or eventual 75 meter AM driver) it hasn't much practicality to offer
the new Tech (or Tech Plus) ham.

HELP...(newbie here) I just bought a Midland 77-115 (seemed like a
decent radio for $65 new.....?) and I need to buy an antenna for it.
I'm using it in a 4x4 with a full removable fiberglass roof (Blazer)..
I prefer the look of a pair, but they would have to be mounted on my
mirrors or bumper... Where can I find something like these, and what

kind would be best?? I heard there are drawbacks to using two antenna, is that true?? (remember this truck sees a lot of wheeling and low trees) Any help would be greatly appreciated....
thanks
 P S (if that radio WAS a good deal, I can tell u all where to get one)

k-bye,
Jonathan =AE

*experimenting with these devils. You'd be amazed at how much power you can
safely
*pump through a very small toroidal balun.
*
*MC
***8

A balun is an impedance transformatoin device. Impedance transformation can be
accomplished by means other than a simple transformer. A quarter wave length of
coax will due a 4:1 impedance transformation, yet therre are no primary or
secondary windings.
Baluns are in two variety, voltage and current. A typical current balun is 20 to
25 type 43 material ferrites beads over the coax at the feed point. This wil
give you a 1:1 impedance balun.

The main purpose of a balun is to balun currents in the antenna, thus preventing
the coax from radiating from the outer shield.

regards
james

Firestick makes a mount just for vehicles like that.....its the SS-204A and
sell for around 18 - 19 dollars....it goes in the back door.

HELP...(newbie here) I just bought a Midland 77-115 (seemed like a
decent radio for $65 new.....?) and I need to buy an antenna for it.
I'm using it in a 4x4 with a full removable fiberglass roof (Blazer)..
I prefer the look of a pair, but they would have to be mounted on my
mirrors or bumper... Where can I find something like these, and what
kind would be best?? I heard there are drawbacks to using two antenna,
is that true?? (remember this truck sees a lot of wheeling and low
trees) Any help would be greatly appreciated....
thanks
P S (if that radio WAS a good deal, I can tell u all where to get one)

k-bye,
Jonathan �

I ran across a person who has a Tram B201A 40 channel rig.
I`m not sure if this is the right catalog number,but it is 40 channel.
The rig looks like it has been in a glass case and no one ever touched it.
It also has an amplified D104 microphone with it.
I was trying not to look stupid while I was looking at it(hard to do) and not asking very many questions.
The owner was asking $250.00 for the rig with the microphone included.
Is this a good buy ???
He told me I could try it b-4 I bought it.
Damn thing is impressive looking.
Should I buy it or not ??????
Thanx for your help !!!!

<<AM is used throughout the HF bands, and the Viking also has SSB capabilities.>>

Thanks. I think we've pretty much figured out what band and mode this particular Viking II is going to be used on.

Not nearly as good as a well built receiver and some filters in the coax
line if your in a busy RF area.
Pick up an ARRL Handbook and make up some from scratch.

cheers

For those that didnt read my first post, I ask"whats the cleanest radio out

there. not just clean sounding but clean as far as harmonics,bleedover,
etc".
Ok I havent herd any disputes that collins is not the cleanest radio around
on the air. My next question is which Collins? S Series, KWM-2 ?
Also is there a military model Collins radio that measure up to these two.
Whats your input?

KRS

You read the post wrong!

And besides how well do you know the names in the list?
How well do you know me?
How well do I know you?

I am not subscribing to your negative response to a positive fellowship with those
whom I talked to.

And besides, if you don' t like my post, take your attitude to another "channel"
or another newsgroup.
It's simple-> change it, turn it off, or accept it!!

Ok I'll add my two bits of humor that really isn't wortha damn. But did you hear that if you have
a spring at the base of your mobile antenna. Have someone pull it back the forward throw will
launch your signal further.

HOLY HOLIER THEN THOU HAM, BAT MAN... Just because I posted in a CB related news group doesn't necessarily mean that it will be used for that purpose. I'm sure there are some people here that are as well versed in electronic theory as in HAM related news groups. I posted there as well and was also aided with the questions that I posed. In fact I post there from time to time, just a couple of weeks ago I posted "I would so like to be a ham sam I am" and other ham related subjects. Also, I don't remember you posting any helpful replies to my queries, however you DO seem quick to jump to conclusions and point your self righteous finger and condemn me for simply wanting an older transmitter. Is this what being a ham is about? I believe your peers would disagree. What happened to ham radio being a tool to promote good will amongst nations and people?

Thanks as always for you opinion,
john

Just to clarify my transmitted audio lacks the crisp highs and it sounds mumbly. It's perfectly clear just deep toned.

<< I don't remember you posting any helpful replies to my queries,
however you DO seem quick to jump to conclusions and point your self
righteous finger and condemn me for simply wanting an older transmitter.
Is this what being a ham is about?>>

Wrong. I advised you of some pros and cons of starting out your ham career with

a Viking II tube transmitter....versus a 1980's-era Japanese transceiver.
You're
perfectly free to ignore or use my info as you see fit. No condemnations given
or intended.

Likewise, why you seek advice and information about a ham transmitter
that you intend to operate in the ham bands from rec.radio.cb rather than,
for example, the boatanchors newsgroup (specifically dedicated to discussion
of vintage tube ham gear) or rec.radio.amateur.equipment (specifically
dedicated to discussion of general ham gear) is certainly none of my business.

<<I'm not an appliance operator, I derive much enjoyment "using" older tools,

they
may be a little harder to operate, that doesn't bother me, the quality of
craftsmanship
far surpasses that which we own today. I own an Allis Chalmers B-112 garden
tractor
which was produced in the sixties and when restored will eat a craftsman
tractor and
many others. As for all band coverage please see above where I referred to a
VFO.>>

> The Viking is a fine classic rig. But except as a CW nostalgia station
> (or eventual 75 meter AM driver) it hasn't much practicality to offer
> the new Tech (or Tech Plus) ham.

<<Practicality is derived from use, if I choose to use it and enjoy using it
then its practical. It has served many hams since 1953. Just because a
company released the biggest battiest newest thing doesn't make the
predecessors of that object junk... that only applies to computers.
Thanks for the response,
john>>

I can't agree more with your appreciation of vintage gear,
be it electronic, or any other kind.

The Viking II is a beautifully built transmitter with a pair of 6146's
in the final RF amplifier modulated by a pair of 807's. It operates on
160-10 meters at a DC input of 180 watts CW and 135 watts AM phone.
The Johnson VFO was designed to match this transmitter as well as its
predecessor, the VIking I. As far as I know, this VFO does not cover the
WARC bands (24 MHz, 18MHz, 10MHz).

Johnson didn't make a matching receiver. Most hams paired up the Viking with a
suitable tube receiver of the same era; Hammarlund, Hallicrafters, Collins,
Drake, etc. These rcvrs have mute circuits and can transceive with xmtrs such
as the Viking when a Dow-Key, Johnson, or other type of coaxial relay is used.

My point was that, while this kind of "nostalgia station" has great appeal, you

will be very limited as to what you can do with it. If this is your only
"rig", you'll
be missing out on many of the modes and bands that your future ham radio ticket

can offer you.

The problem is kind of like that HandD channel we all hate but listen to from time to time. These newsgroups have turned in to those channels. Kind of like Pavlovs dogs you have people who think they own and dictate how to use them. Well I say toosha to you. We can all ask and do what we like. If the power mongruls dont like it they dont have to respond.

Ive got two words for them SUCK IT!!!!!

You aren't going to get much range with a handheld and much depends on how you are going to use it. If you are using it around the farm, and the radio on the other end is a base station with a good antenna, you can go out seven or eight miles fairly reliably, and probably talk with most of the adjoining farms.

The city is a little more difficult. Just a few blocks with a handheld. Again, if you are walking a neighborhood watch and there is also a base station nearby, it will probably have enough range, but if you want to talk across town, it isn't going to be of much use.

The CB frequency is subject to noise from sunspots, so night communications will get you further because there is less background noise. You won't work any "skip" with a handheld, but skip probably wouldn't be much use to you in most emergencies that you are likely to face anyway.

A lot of cars and trucks have CB's ... and it can be a backup if you are traveling. You will have to be in sight of the other vehicle that you are trying to flag down, but at least you can convey the type of help you need.

There isn't one radio setup that is ideal for all situations, and if you have the bucks, have a CB in each vehicle and one set up in the home. A few FRS handhelds would be nice ... and perhaps a no-code ham license and station as well as a cell phone to round and short wave receiver to round things out.

A handheld as a regular radio is probably the worst possible solution to all but close in communications in my view, but still better than none.

Frog@mageos.com wrote:

> I recently picked up a 4W GE handheld CB on sale for possible emergency communications use. I have no previous experience with this particular form of radio communications, though have extensively used other systems and frequencies.
>
> I see a radio seller's page that gives the unit a range of "100 feet to 100 yards +" which seems incredibly short for 4 watts, even with a short handheld antenna. I mean, why bother? I can _yell_ better than that.
>
> Is that range estimate in error? What is a _typical_ maximum useful range for a 4W handheld CB? I don't have anyone to test this out with, so I'm relying on the accumulated experience of users here.

The entire no-code debate is about the code testing requirement, not elimination of the use of CW. So, obviously the comment above was a comment about the pro-CW testing group. Therefore, Mr. Jones, I do know the players. However, thank you for your comments.

Radio Shack sells several mirror-mount antennas. A new one (21-804), which looks a lot like several of the Wilson antennas, may be just what you're looking for.

Or, you may want to go with the standard twin 102 inch whips on the back bumper (also available at Radio Shack).

The MFJ-815B does not need 12v power for SWR or RF power readings.
The 12v power is only required for the meter lamp.

By the way, you can obtain another manual from MFJ (www.mfjenterprises.com).

It IS a nice antenna. You should be more omni-directional now... Also, if you wanted to try another "remedy," I would take about two ground straps from the trunk lid to the other part(s) of the car to provide a better ground on the trunk. This would also create a front directional..... (eg most of your signal would go forward)

Hank

There is an optional whip for the wilson antenna's. 1000, 5000 and it will work on the k40 as well. It is the wilson short whip. It's about 3 foot long or so with a load close to the base. Maybe that will help on the lengh of the stinger.

Here is a new idea for this string. Buy your own tune up manual. That way you will have the information and will have paid for it. Then if you choose to give it away free, then that is your option. That wasn't so hard and may have already been answered in this manner.

No need to get mad at a Man or Woman who doesn't want to give their livelyhood away. Thats what pays their bills. Believe it or not some people on these news groups actually use some information recieved out of a string to repair radios. Thats ok too. Your local tech will be pleased with the added workload to fix the mistakes. Or tell them they have trashed a perfectly good radio. The information is for sale, so order the manual.

Have a happy holiday. God Bless you.

Yes.

Cetron, Penta and a couple other brands still do exist (although they are Chinese made tubes, and do not usually come with any or a decent warrantee).

Svetlana recommends putting the 572b in boxes using the 811A. It works well, has more dissipation and can handle more plate volts / grid drive.

Better all around tube, although it does cost about 50 percent more. However, barring equipment malfunction, it will last forever.

Probably more accurate would be "100yards to 1000 miles." The typical Citizen's Band transceiver uses an AM (amplitude modulated) signal, which is very inefficient, requires a lot of power, and receives 60-cycle and electronic noise as loud static. Under optimal, quiet conditions, a "barefoot" CB'er with a stock 27 Mhz radio might talk clearly to another station 1200 miles away -- I've done it many times, usually very early in the morning. The flipside is that we today have many times more electrical noise running through our atmosphere than when CB was established. CB in the city is usually a lot of squeals, squawks, and noise with a little signal and even less range.

An advantage is that CB radios are dirt cheap, and there are thousands of regulars on the air at any given moment. This alone makes it worthwhile to have at least a mobile CB. Personally, I prefer a radio that can also use the SSB (single sideband) mode, because those allow 12 watts with a much better and quieter signal, and long-distance "skip" is more reliable.

And who elected you the judge of whether or not *I* know what I'm
talking about? Maybe if *YOU* knew what you were talking about and
listened to this issue from the roots of the common people that have to
deal with it, you'd get the feedback that I did.

Comments filed on behalf of the NPRM only reflect a very small segment
of the ham population, and cannot be considered as "the voice" for the

hobby in general.

>
> >

> What is totally lost in all this noise is the fact that CW supporters are ALSO digital mode supporters. How is that, you say? Well, for one thing many CW operagtors are also digital mode operagtors.

And many others aren't so what's your point?

Besides, what does that have to do with anything? Nobody is talking about eliminating THE CW MODE, only the mandatory testing of it.

> And just wait until all the anticode yakkers flood the voice segments. The very next "I WANT" rant will be for expanded voice segments at the expense of the digital/CW segments. No question about it.

Your paranoia is typical of the "pro code" side. This fear paranoia, that they will lose their precious CW band segments to "other" modes, is what keeps them focussed on preserving the CW test at all costs, and blinds them to any rational thought in regard to this subject.

> When the fone bands are overloaded, there WILL be a movement downward, and flushed with the success of having just killed the code requirement, there'll be no holding them back.

I don't consider opening up VOICE modes to be a bad thing. When was the last time that ham radio has made any significant contribution in the communications field? Maybe if we can open up new band segments for digital voice or spread spectrum, maybe we can at least keep up with the commercial sector.

> If ham radio isn't dead it sure is seriously ill.

Agreed. And holding on to ancient modes, and the testing for them, is what's killing it.

>
> Having something shoved down your throat does not foster
> > the best attitude, and many may develop an "anti CW" attitude, because of all the pain they had to go through to learn something that they have no use for.

>
> Unhuh. Just as it alway was. The difference is that those
> childish folks you mentioned will NEVER learn what
> radiotelegraph as a mode actually is, they will only know
> what they percieve as unlearned individuals.

Why should ANYONE need to learn the CW mode? Why? Would someone please tell me? What relevance does it have TODAY? It's one thing if you are into history (or if you are history ;)) and want to relive some nostalgic walk down memory lane (And you can trash your ICOM 781 for some old 2 tube beauty as well). And if you want that extra few miles that the reduced bandwidth can get you when working DX, then fine, it's YOUR CHOICE. But it shouldn't have to be EVERYONE'S choice.

> Of course,

> truly be declared as lifeless, and can be given a pauper's
> burial.

Surprize! Do you want to know the REAL reason why CBers aren't flocking to the ham bands in droves? HINT: It's not the code test.

The real reason is that CBers consider hams to be stuffy, arrogant, cliquish, standoffish, generally unhelpful, and egotistical (With some exceptions).

This very topic has just been extensively hashed out on rec.radio.cb, and a dejanews search should be enough to back this up.

I would think, with the recent publicity of the ranting on 75 meters (of all genrals and higher class, who had to learn the code) by people with less than ideal moral character, that you would have enough to worry about without that old "The CBers are going to get us" paranoia.

Evidently the commercial sector disagrees, as they have all discontinued
regular CW usage. Only ham radio dogmatically continues to emphasize CW.

> Many use it half of their operating time. Many others operate no other mode.

And many never use it at all (myself included), so what's your point?

> We are, at least those of us who continue to breath, going into the 21st Century

No, but in case you are too blinded by your passion for CW, that you fail to notice that Ham radio has become stagnant. There have been no new technological breakthroughs. We live and function at the whim of Icom, Kenwood, and Yaesu, and other companies capitalizing on the lazy appliance operator that seems to take up most of ham radio, today. Soon it won't be CW that we are argueing with the FCC over keeping, it will be defending the ham radio service itself, to an FCC under increasing pressure for more frequencies, from commercial sector users, to develop even more digital widgets, so that we can do E-mail from the toilet and such.

If we don't grow as a service, we will wither and die. The old "providing emergency communications" arguement is slowly losing clout. With cellular and other radio services becoming more reliable, and convienient, there may not be a real reason to keep ham radio, for that purpose. And since we now lag, rather than lead the communications field, we certainly are not the "sandbox for radio development" anymore.

How's that for doom and gloom? Think about it.

Ad Hominem comments do nothing to bolster your credibility in any form
of debate, so you would be wise to avoid them. Stick to the topic. If
you were more observant, you would see that I am a licensed ham as well
as CB radio user. In fact, I don't consider myself a member of any
group. I am a "Radio Hobbiest". I play with whatever radio bands are
available to me. I don't look down from my holy perch of hamdom to other
radio users. I interact with them.

> If you check the comments sent to

NOW they do, now that someone has finally seen the writing on the wall.
That and the fact that the "oldest" fossils are finally dieing off, and
being replaced with younger, more forward thinking people, has a lot to
do with it. Each time this issue comes up, there is less and less
resistance to it. The last time, the FCC proposed the no code VHF
license, and it was shot down by the ARRL Fossils, the result was the
loss of the lower part of 220 Mhz. So guess what, the next time the FCC
said "no code"?, the ARRL reluctantly agreed (Lest they lose even more
bands). It's no different now. Adopt newer licensing guidlines, or risk
further slicing up of the bands.

And your ability to determine who you are responding to, leaves even
more to be desired. That was not my statement, but the guy that *I* was
responding to. And again, you have no authority, or right to make any
judgement calls regarding *MY* qualifications. What you THINK about me
is irrelevant. Your attempts to deflect the issues into a personal
namecalling match will fail.

I never post anonymously. I have nothing to hide. But I don't go proudly
attaching each and every meaningless title or club affiliation to the
body of my text.

I will have to eat a bit of crow though. Since this thread became crossposted to rec.radio.cb, the users there, have had a chance to see what "real" hams are really like. Just after I got done defending ham radio and many of the operators that I know, in my circles, guys like you come on here with ad hominem attacks, unjustified condescending comments, and general jungemental namecalling, without any facts to back it up. You've just gone and erased all of the good feeling about ham radio that I've tried to bring to these guys and reenforced their initial beliefs that hams are egotistical, arrogant, condescending, unfriendly, and unhelpful.

Thanks alot pal........

Dave

The record of resistance that the ARRL has had to FCC "suggestions"
concerning "modernizing" ham radio have been well documented. When the
idea of a code-free VHF license was bandied about not too long after
"novice enhancement" (remember that?), the ARRL shot it down, and then,
right after that, the FCC took 220 - 222 Mhz, from us, and gave it to
UPS, who really didn't want it, and are not really using it today. This
was the FCC telling us, in no uncertain terms, that we'd better wise up,
or lose out. So the ARRL all of a sudden "recommended" a no-code
license, and it passed. Coincidence? I don't think so.

Why not? It's no different than you dogmatically sticking to an outdated
requirement that CW must be learned.

A "modern" reason. Ok, with the advances in communications technology (Which was developed outside of ham radio while hams relaxed in their easy chairs working some rock in the middle of the ocean), it is no longer necessary to use CW, in all but the absolute extreme conditions. Since there is little that CW can give you over other digital modes or voice, and that there are so many modes that a prospective ham may choose, it is no longer necessary to know morse to operate a ham radio (This is not the 1920's). Note that the key word is "necessary". What you CHOOSE to do, is your own business. But it's not right that a few dogmatic people make that choice for everyone. If you love CW, then GO FOR IT! Use it, have a ball! But don't tell a prospective ham, that in order to play with their latest digital QPSK or QAM project, on the air, that they have to learn an archaic telegraphy skill first.

This stubborn dogma is what's killing ham radio. If we can't let go of the past and move forward, then we will wither and die. Some of you guys that have maybe another 5 or 10 years left before you are pushing up daisies, can sit blissfully happy working CW, just like you did 50 years ago. But alot of us would like to have ham radio as a hobby, 50 years from now. But to do that, we have to move with the times.

No one is suggesting that the usage of CW be discontinued, only the requirement for having to know it, to be changed. It makes little sense, for people desiring HF VOICE or DIGITAL privileges, to have to demonstrate CW proficiency. Keep the CW test for privileges on the CW bands only. At least it's related to the mode that you desire. Would it make sense to you to be required to know how to swim, in order to qualify to ride a motorcycle?

If you're thinking of 11 meters, then you may as well tear-up that ham
license of yours - the new enforcement environment guarantees you'll loose
it if you get caught on 11 meters with it.

Keep reading-- Part 6, under the heading Reflected Versus "Lost" Power. Here, he discusses what happens when the 50 ohm transmitter "sees" an impedance other than 50 ohms (no conjugate match).

It is true that you did point out the weaknesses of the transmitter and overall lay out of the rig that I would like. This won't be my only radio, but will be my preferred rig for the modes and bands its capable of. This will cost more, but it is a hobby and not meant to be cost effective. The reason I chose this transmitter is that I already own one, in less then ideal cosmetic shape, and another was made available.

>
> You're
> perfectly free to ignore or use my info as you see fit. No condemnations given
> or intended.

I could be wrong but if I remember correctly "Thanks. I think we've pretty much figured out what band and mode this particular Viking II is going to be used on." implying that the radio I was looking at was to be used for AM transmissions in the CB band, in a court law the conclusions which I draw from your statement wouldn't stand. However this isn't a court of law so lets be truthful with each other and not play word games.

>
>
> Likewise, why you seek advice and information about a ham transmitter

As I have said, I have posted there also, and have received alot of help and info to the questions I've posted. As to why I posted here, obviously there are people in this news group that have experience with these transmitters, and to dismiss these people and their info just because they may not have a ham ticket would be awfully foolish of me. Information in itself is not inherently bad, what a person does with said knowledge is an other matter.

Regards,
john

I have seen Buckmaster with their database for Amateur Radio Callsigns for the US/ International

How about a database that has the Callsigns of SSB Operators either operating in the 40 channels or "Freebanders" for QSLing them.
I have heard a few stations above 27.405 MHz AM/SSB operating SSB either Lower Or Upper Sideband.

Sounds like a good idea for someone like myself who would like to QSL a SSB station that I heard on shortwave above 27.405 MHz

Does such a database even exist yet that allows users to search for a 27 MHz SSB station the same
way the HAM CALL Databases do?

Sean

Computer companies didn't intentionally create this problem to
make more bucks and I don't think saying programmers where
short sighted is true either. Back in the day, when most of this problem code

was written (60s-70s), disk and memory space was expensive and very hard
to come by. Programmers had to save space anyway they could
(both disk and RAM)...so they could cut out 2 digits from every record
they had (from the year field) - and in most cases this saved them tremendous
space.

Any computer system that is super important - is already fixed. People
are making a buck off the hype more than anything else.

Bob.

Ah, "the hobby in general", including the same Freebanders, hey? No, I'd say they won't be writing the FCC for any reason.

Indeed! First you say that *I* am paranoid for beleiving
that yakkers will insist on invading the digital/CW
segments, then you prove my point by saying you're in favor
of just that! Thanks for your support!

When was the
> last time that ham radio has made any significant contribution in the

Typical no-coder rant. IF you really believe it, it just
shows how far out of touch with reality you actually are.
But since its just more of a No-code Agenda, it doesn't
count,of course.

> > If ham radio isn't dead it sure is seriously ill.

> what's killing it.

  And that is just another load of pure male bovine
excrement. Lawless idiots, both within and outside are much
more the primary source.
So Dave - "Sandbagger", what advanced digital modes are you
set up[to use right? SSB, on 27 mhz??

No, pal, it *IS* the code test, period. The FCC knows it,
too. aLL your bluster and bluff is for naught. The old heads
at FCC remember it all too well. It's currentlyu the ONLY
thing holding all your buddies back. You know it, only too
well yourself. Hence the strong effort to trash the code
requirement, en total.

>
> The real reason is that CBers consider hams to be stuffy, arrogant,

Ah, I guess we should just welcome the trashing of our HF
ham bands by all the yakkers who know nothing and care even
less. Won't happen.

> This very topic has just been extensively hashed out on rec.radio.cb,

Couple dozen idiots out of half a million licensed to use
those bands? not too bad a percentage, actually. Mental
problems are widespread.

>
> Dave
> "Sandbagger"

 Just keep on sandbagging, Dave. Eventually you'll make par.
But don't get too excited about bringing all yer lawbreaking
buddies to ham radio. It doesn't look too promising.

does anyone have the mods for this particular unit? I know there is a
modulation mod.. but what are the power mods? I have seen some but i am
confused as to if i should have the radio tuned after or just not to
worry about it.. If you could tell me which components to mod i would
greatly appreciate it...

Chris

I don't remember him saying that he talked to his uncle, only that he checked around on his computer for something that ended up not working. I'm sure that if you re-read the young man's original posting, you'll find this to be correct.

Psst! I hope you'll not take this as an ad hominem attack:

It is "radio hobbyist". It is also interesting to note that you advocate doing away with morse testing so that others can "play with whatever radio bands are available". Is that the advancement you've talked about?

Are you now or do you contemplate becoming a commercial operator? I
don't believe your comments have any bearing in a discussion of amateur
radio licensing. Morse code useage among hams is quite commonplace.

> > Many use it half of their operating time. Many others operate no other mode.
>
> And many never use it at all (myself included), so what's your point?

The point is that CW is a mode in widespread use. That, if nothing
else, is a reason we test for it. The point is that you mention CW as
if nostalgia value is the only value it has now. The point is that you
are incorrect.

> > We are, at least those of us who continue to breath, going into the 21st

I'm not "blinded" anymore than I "live at the whim of" any manufacturer
of amateur gear. You can e-mail from the toilet now if you like.

> If we don't grow as a service, we will wither and die. The old

If cell sites can't link to the non-cell telephone system, as might happen during a widespread weather emergency, there'd be little likelihood of communicating via that mode.

Hams haven't been in the forefront of radio development for decades unless you count engineers who happen to be hams.

> How's that for doom and gloom? Think about it.

Okay, I've thought about it. I still don't think you have a handle on what is likely to happen or why we test for CW. Just out of curiousity, how long have you been involved in amateur radio?

This IS getting tiresome. We did this a few posts back. Morse code is a widely used mode. That's why ANYONE should learn it. Now, someone has told you (again). It is not a nostalgic walk down memory lane; morse is in use today--now--this minute.

Collins equipment is over priced tube equipment from the 60's. The designs for
the S-line and the KWM-2 line are both over 30 yrs old. They were designed for
military and amature use. They are tunalble to the CB band. My opinion they are
extremely over priced. Care is needed in buying these rigs. Go after ones made
with teflon wire. Some of the newer dates havea little to much Rockwell and not
enough Collins. By that I means Rockwell bought out Collins many years ago and
some feel that the Rockwell units are poorer manufactured.

****

Generallly speaking one that has not been touched by the local idiot that thinks he is a tech. Most out of the box units that are designed for the US market only must meet certain specifications to be type accepted. There are a large quantity of non-type accepted "export" models that are available. How harmonically clean are these units is uncertain. How well designed the units are is of concerns. Don't let price tag determine what is the best rig. Price tag generally indicates a popular rig and not necessary the best. While many here will condem Radio Shack units, they are very clean. They are also somewhat over priced in my opinion. Most don'y like them because they can not be easily operated outside the standard 40 channels and they are not modifiable much for increased power out. Basically it is a "what you see is what you get" radio. There are other brands alos that are available that are good clean radios.

A second note on a harmonically clean radio. Never have the modulation limiter cut. It should be adjusted to your voice, but never permantly disabled. This can lead to over 100% modulation of AM full carrier and thus splatter and harmonic genration.

*yards +" which seems incredibly short for 4 watts, even with a short
*handheld antenna. I mean, why bother? I can _yell_ better than that.
****

Yeah but your throat will get sore soon. Depenading on terrain this is pratical.
If you are inside a building or a house trying totalk to someone out side with a
handheld, 100 to 300 yards is about it. From inside your house withthe internal
antenna to a base station, the distance can be 800 to 1000 yds. Put and external
antenna onthe handheld and it will have the same distance as any 4W unit on that
same antenna.

You don't need codes for CB. Just use a southern accent, cuss a lot and you will fit right in.

Greetings!

Whats that date of these posts?

March?

And you still can't get over the fact that you left CB, to become a ham, and you're back again?

LOL!

I told you that you'd be back, and I was right!

ROTFLMAO!

As said before...

"Welcome Back"

While Dancing with the Mouse on Mon, 22 Nov 1999 23:57:50 GMT, the Modem interrupted with an MNI from "hingram@amel.tds.net (AC-001-VA)", and the MotherBoard buffered this to Video RAM:

*Recall that one wave length of transmission line is given by the expression:
*984*1/freq. = wavelength
*
*However this is not a true wave length for all transmission line. The above
*formula must be modified by the velocity factor VF in order to get the
*correct length. The new formula is: 984 (VF/freq.) = wave length.
*
*You may ask what is this Velocity Factor: Hear is the answer. The speed of
*the signal in a transmission line is slower the a radio signal in free
*space. This leads to the velocity factor F (I call it VF not to be confused
*with Freq..) which is the ratio of the transmission in the transmission line
*VL and the transmission speed in free space VS.
*This will give use VF = VL / VS. This number will vary from 0.6- 0.8
*
****
the velocity factor is determined solely by the dielectric material used in the coax. This due to electromagnetic wave propogation thru dielectics varies depending on the material. Many schemes have been used to speed this wave up. Different materials, ie teflon, polyethelene, and even air. ANother method to improve on polyethelene was to change it from a solid to a foam. Thus the introduction of aiur into the dielectric helped to increase speed of the wave traveling down the coax. Air is used in high power transmission lines. Thus the velocity factor can range from about .6 to .99 in coax. Generally speaking the higher the VF, velocity factor, the more expensive the coax is. This due to construction of the coax and not the materials.

I believe that on AM full carrier audio compression works good only to limit to 100% modulation. As for effectiveness the rannge increase is minimal. On SSB the effects of audio compression is about 1dB increase. Clipping can give you about another 3 dB increase. RF clipping is by far the best to increase effective range.

All the processing means still will help only slightly.

*Never heard of these tubes. What kind of output can be expected from 4
*of them?
****

Four tubes in plate modulated AM carrier service with 650 VDC on the plates will yield about a 120 Watt carrier. IN SSB amp service with 650 VDC on the plates and 250 VDC on the screens, one could expect to see up to 250 W PEP output. I once ran an amp with two and had 40 watt carrier with 3 watts drive. Had the grids swampped with a 2700 Ohm resistor. Four can get you 80 W carrier and about 320 PEP oout. Now if you really want to push them, raise the plate voltage to 1200 VDC and drive the piss out of them and you will get about 500 W PEP. The tubes will not last long and your neighbor's electronic equiptment will suffer some interferrence. If yo want a nice 250 W PEP amp, four will work nice. Becarefule though the output capacictance of this tube is high. About 8.5 pF. Four tubes in parallel will yield about 35 pF. This will make it more difficult to tune with a conventional pi-network at 28 MHz. At 650 VDC the plate load resistance maybe to low to effectively tune a four tube amp. I reccomend running the plate voltage as high as 750 to 800 VDC and the screeen should be regulated to about 180 VDC. You can even raise the plate voltage up to about 1000 VDC. I reccomend the screen voltage not exceed 200 VDC in this case. The control grids will have to be swampped with a 1K or lower resistor to reduce the gain of the amp and make it stable.

> There was no "intentional hiding" of the problem.

Computer companies didn't intentionally create this problem to
make more bucks and I don't think saying programmers where
short sighted is true either. Back in the day, when most of this problem
code

was written (60s-70s), disk and memory space was expensive and very hard
to come by. Programmers had to save space anyway they could

(both disk and RAM)...so they could cut out 2 digits from every record
they had (from the year field) - and in most cases this saved them
tremendous
space.

Any computer system that is super important - is already fixed. People
are making a buck off the hype more than anything else.

Bob.

Happy Thanks Giving is coming up and I want to say happy gobble gobble day
to every one on this group! All kidding aside, take a time of silence to
think of your family and friends and all the good that this world still has
to offer going into Y2K. If you can try to take a little time out of this
busy world during the holidays to show those people near and dear to you
that you still care and love them. And above all give thanks to the Most
High, who ever or what ever he/she, or it is to you, for the very breath of
life that's has been blessed upon you.

Peace,
KRS

<<I could be wrong but if I remember correctly "Thanks. I think we've pretty much figured out what band and mode this particular Viking II is going to be used on." implying that the radio I was looking at was to be used for AM transmissions in the CB band, in a court law the conclusions which I draw from your statement wouldn't stand. However this isn't a court of law so lets be truthful with each other and not play word games>>

I'm not interested in word games either. If I misunderstood your intentions, I apologize. But I think others may have misunderstood too.

Most respondents to this thread also assumed you were going to put it on 11 meters. Look thru the posts. The majority are giving advice about how to put the rig on CB.

Bottom line, it's you and your conscience. Good luck whatever you decide.

> can offer you.

The Viking won't be my only HF rig. First things first since I'll be getting a
Tech
ticket and not bothering with 5 wpm(I figure if I learn 20 wpm from the start
I'll
be avoiding that 10 wpm plateau that I hear takes a long time to overcome.) My
first vhf-uhf radio will be a used IC-Z1A or a IC-W32A or possibly a FT-51r,
something I can walk around with and use at home. Then when I save enough money
and
when I upgrade I'd like to get an IC-706MKIIG. I've heard nothing but good things
about icom. So you see I don't limit my self strictly to older equipment, but I do
prefer it. There is nothing more pleasing to the eye as an old radio rig that
takes
up the entire desk emitting a warm glow in a dark room.

Good day,
    john

There's a nationwide group of hams that are AM
enthusiasts who run boat anchors such as the Viking II.

You might try listening to 'em in AM mode between 3.870 and
3.880 in the early evenings because it's pretty cool to
hear these old rigs on the air. They are into high-fidelity
"broadcast style" audio, and so there's a lot of tech info
exchanged.

Here's one url that you may find interesting as it
has some Viking II info:

http://www.thebizlink.com/am/tech/htm/mods.htm

Also and index to some general info and articles about
AM boatanchor operating at:

http://www.thebizlink.com/am/tech/htm/tech.htm

These guys that speciaize in this mode and
they can answer your questions a lot better and a
lot faster than I can.

Also you might get a line on a good receiver from
them.

Good luck.

> radio licensing.

It most certainly DOES relate to amateur licensing. The rest of the
radio world, has acknowleged that CW is antiquated, and has outlived its
usefulness, and has been replaced by more modern modes. It's usage on
ham radio is driven mostly by either dogma or nostalgia. Certainly not
for its convienience.

> Morse code useage among hams is quite commonplace.

And if testing is abolished, your fear is that interest in CW will fall
off, and then the FCC will remove the "protected" CW segments.

Preserving CW is something that is important TO YOU, but not necessarily
in the best interest of ham radio as a whole

>
> > > Many use it half of their operating time. Many others operate no other mode.

Then you tell me a better reason why someone would prefer to tap out
their messages at 13-20 WPM rather than comfortably speaking them at
275+ WPM?

> likelihood of communicating via that mode.

Keep on holding on to that thought, for soon it won't be true anymore,
and then what?

>
> Hams haven't been in the forefront of radio development for decades

> unless you count engineers who happen to be hams.

But it USED to be! SSB, Repeaters, Mobile radio, antenna designs, and other things are all developments that started off as "crazy ham ideas", and were adopted by the commercial industry. We used to be LEADERS, now we're barely followers.

You squawk at the though of reducing the code test, but why aren't you as passionate about the lowering of the theory test standards?

If it were up to me, the code test would be history, and the theory test would go back to what it was in the 50's and 60's. Comprehensive. No more multiple guess.

>
> > How's that for doom and gloom? Think about it.
>
> Okay, I've thought about it. I still don't think you have a handle on
> what is likely to happen or why we test for CW.

And I feel that you aren't living in the real world, by insisting on the continuation of a skill that has long outlived its usefulness, and is only continued for purely recreational and nostalgic reasons.

> Just out of curiousity, how long have you been involved in amateur radio?

Long enough. (As if that's relevant)

Dave

Greetings,

What do you folks think of this rig?
http://www.bills2way.com/equip/deltaforce.html

It is called the DeltaForce by RF Limited. It looks good. Does anyone
know any mods?

Paul

No offense Xforce but although 55 makes one of the best coiled quarter waved cb
antennas. It simply DOES NOT COMPARE to the half-wave mobile that dave makes.
Simple logic for those that have tested it and those that have not....

```
A HALF WAVE ANTENNA WILL ALWAYS BE BETTER THAN A QUARTER WAVE ANTENNA!!!!!!
ICE IS OUTTA HERE!!!!!!!!!!

I was the high bidder in a Ebay auction for a Texas Ranger
699WX(#202046781). The seller was "swilcox03@snet.net ". Has anybody bought
anything from him through Ebay? The auction ended on Sunday and he has yet
to answer my e-mails for shipping charges, or even where to send the money
order. Must not want his money???? This seems kinda odd to me has other
e-bayer's have gave him very good feedback. This was my first attempt at
ebay, not a very good one. I'm not pissed about this very much as I didn't
loose any money, it's just that if I had posted several things on Ebay I
would at least moniter my e-mail.

This works wonders but the antenna must be a gold plated 102 and you must be
keyed up on 500 watts or more.

OOK CW is allowed on any frequency. Even if one voluntarily limits
one's operation to the CW/data segments, CW shares the band with data.
I believe ONLY 6 and 2 meters have CW-only segments.

Not necessarily. You may find the +2 has a capacitor on the audio output anyway so the DC bias on the mic line shouldn't impact it. If it is a transformer output, or is otherwise pulled to ground, it would be good to add a DC blocking capacitor to the unit. .1 to .33uF is plenty. This goes in series with the mic line.

MC

HI I think I have nearly the same CB (GE handheld).. I got a pair of
them from all my Marlboro =AE miles (1100 miles..sheesh) Anyway i've
used them in the city and out in the woods....in the city your lucky if
u can get around 6 or 7 city blocks.. In the woods your lucky to get 1
a mile... Its a drag to pick up everyone else, but never to have them
hear you...Although I have never tried them with a different antenna,
they cant be heard by ANYONE... All in all I highly don't recommend them

k-bye,
Jonathan =AE

davemades 1/2 wave have proven to have 3db more gain than a 1/4 wave, which
is exactly the gain that you should have going from a 1/4 wave to a 1/2
wave. Just curious how 55's can be any more out of this world when the laws
of physics apply 3db is still 3db.

I beg to differ with you. I have many programs that were written in the mid 90's right up to 97/98 that are not Y2K compliant. There is no excuse for that. I find it very hard to believe that (a) they didn't realize that a two digit year date would be a problem and (b) that they were concerned with saving space by this time.

I find it much easier to believe that it was a case of planned obsolescence. By the mid 90's, the software industry already had consumers used to buying an upgrade for their product every couple of years. Why should they release a Y2K compatible product in 95 or 96 when they could release it in 98 or 99 and force another upgrade on everybody? Y2K compatible bios chips didn't start to be plentiful on mother boards until the latter part of 97. Windows 95's Y2K bugs weren't fixed until after the release of Windows 98. WFWG (3.11) is still a viable operating system for slower machines out there that do not run games or edit graphics. Yet Microsoft chose not to make it Y2K compliant. In fact, they abandoned support for the product all together. Was this because they didn't want to spend the time and money to fix it, or because they would rather consumers bought a new OS and or computer? This whole Y2K thing is in my mind, one of the most insidious scams played on consumers in recent years. I'm glad it's a once in a lifetime occurrence.

A four foot telescopic antenna with a center load will get out 5 miles
or more during no skip conditions. You can get them at Radio Shack for $
24.95. On a little rubber duck antenna you should always be able to get
out at least a mile or two during good conditions.

I like clipping and running with no limiter.

Kill the negative portion of the waveform and let the positive control all
the modulating voltage!

Bullshit, Joey.... That is all you play... Games.

Headgames...

Wordgames....

All types of games. Nobody will even attempt to carry on a debate with you any longer because all you do is attempt to turn words around and play games with them.

If I misunderstood your intentions,
> I apologize. But I think others may have misunderstood too.

There is a first.. You thinking.

>

Really?

Like who?

Look thru the posts. The majority are giving advice about
> how to put the rig on CB.

Or, how they hooked one up with a CB for a receiver.

All the modifications that are necessary to put it on a transciever for 11 meters would hold equally true if you where going to put it with a Kenwood for RX.

YOU! where the "ones" that where implying he was going to run it with a CB radio.

The area above the 440 ham band (450-512MHz) is loaded with business
type communications much like the area above 150 MHZ.  The modified 2
meter radios
have attracted attention from business users and police who track with
doppler set-ups.  (see www.dopsys.com)  Commercial Folks arent HAMS so
beware
of their compliants, the band is also used by the mobile telphone
service, so
it can get a high priority.  The FCC would be the least of my worries.

The real answer is "it depends." First off, your 4w handheld is only 4w untill
the first time you transmit and then your batteries start stopping as does your
```

power output. Second. Who you talking to handheld to handheld from a car? Across clear open spaces? handheld to base, base on a hill or in a valley. What channel, On trucker channel 19, your luck to get to the next car with all the noise on the channel. You also have to take a look at the antenna. On the handheld you dont have one, You have a rubber stub pretending to be an antenna. A full size cb antenna is 34ft long.(17ft on each side of the transmitter). And after all of that, just how good of a receiver does the radio have? Most "emergeny" radios are bottom of the barrel receiver. Designed for low cost and thats it. So 100ft to 100yrds might be correct. Real world maybe a mile mobile to mobile, maybe 2 miles handheld to base. It depends.

In article <19991123010810.777.HaLoPa@nyarlatheotep.frog.org>, Frog@mageos.com says...
>
>I recently picked up a 4W GE handheld CB on sale for possible emergency

No...but you can get a Superstar 4900+, which can be modified, for
$179.95. Same radio, but has not got the fear of the F.C.C. fueled
limitations built in.

i think we all need to remember they do not operate a normal type of mom and
pop business and well ill leave the rest up to the imagination. No doubt the
product is a good one.

TF, in your opinion it seems BBS'es are still invaluable.... Should I put
mine back up? I was working on a web driven BBS, though that is another
story..... People let me know and I will do it... in two months I have a
cable coming to the home anyway, so, what the hell......

Bill,

While the remark that MC 10kW made does sound a little derogatory, there is much to be said for a piece of equipment like the IFR. I couldn't get along without my 1200 Super S. However, there are many repairs that are made much easier with my old discreet test equipment. (i.e. B&K 2040, Sencore SC61, and the list goes on and on) I think you get my point. ;)

What it means is that in the post preceding mine the person infers that
the President 2510 does not have variable power by mentioning that one
of the features that the 2950 has that the President does not, is
variable power. The facts are that the President 2510, ( Lincoln ) does
have variable power...got it now.

If he is using it for emergency communications presumably he would be calling on channel 9 -- the emergency channel -- which is monitored in my area by the Highway Patrol, and by REACT in some other areas.

If that fails than you would try to contact a passing trucker on channel 19. The advice about getting an external antenna on top of the vehicle is a good one.

Then, he apologizes at 9:59, same day.

Just another little insignificant little crack.

We don't care how long you have been on the "newsgroups"... If you truly
where as well versed in the art of the internet, you would not have compared

a newsgroup to a BBS... Two totally different things, and I highly doubt that you could tell us where UseNet originally came from. And why.....WHY!!! would someone who was so well versed in the internet, and been around since the beginning be using AOL????????

If you want to come on the newsgroup and ask for help,

"of all the experts on this group no one can help me with how to modify channel
expansion and clarifer and 10k sw on. come onnnn

would be greatly appreciated
thank you"

then I suggest that you change your attitude. That is the only reason that I never said anything.

Saturn: Blue wire.

Clarifier: I don't want to tell you how to do it, because if you fuck your radio up, I don't want to be the responsible one for telling you how to do it in the first place.

10Kc switch: Stock. If yours is fucked up, I wouldn't doubt it has something to do with your lack of personality..... I mean, lack of soldering skills or electronic skills as a whole.

We care that you are a DM. DM of what? Radio Shack? Circuit City? Good Guys? AutoZone? Really, but we do care!

About your comment that their are only a couple CB tech jobs per state??? Well, that is all their REALLY needs to be, but since their are so many people into fucking their radios up... err.. I mean, modifying the radios themselves, we have to have a lot more technicians out their to fix their stuff. Sad, but true.

And then, why would you come here and ask for help, since their is only need for two techs per state? Why not run down to your local technician and ask him how to do it. I am sure that he would rather tell you than do it himself.

This is my first time posting on this thread.... I wasn't going to help you just because your a prick, and came to get something for nothing, and when you couldn't do it, you sold the radio at a loss. But, don't expect people on this group to give an asshole anything for free... Life just doesn't work that way.

Have a nice day, Senora Ice Shark..

Develop a personality.

No, Turner didn't...

No might about it.

Turner made the + series microphones with compression built into them.

Astatic made the popular "lollipop" microphones with the monicker D-104 on
them.

The purpose of the 102" spacing is to insure a strong signal directly in front of, and behind, your vehicle. This layout is ideal for the trucker who only wants to talk to other truckers on the road directly ahead and behind him. But, for a person who wants to talk in all directions, there is no benefit to the 102" spacing.

I stopped going to BBS'es several years ago because I felt that too many of the operators were getting a little too nosy. Too many started to demand my name, home address, phone number, and a whole range of other information, before they would allow access. Some even started asking for employer, work number, birthdate, and SSN, during the sign up process.

Since I felt that much of this information could easily be used for the wrong reasons (and the operator had no business knowing any of this), I simply stopped signing onto BBS'es.

Today, I doubt that I even have any software easily available to access a BBS - I'd have to search the internet.

Those would be the Palomar 310M mobile amplifiers.

1 driving 3 X 8950, and they would do an honest 350 to 500 PEP watts.

You could get 1000 out of one, but they would die quickly like that.

```
They are old, and absolete (unfortunately)...  The switching transistors
that they use are near extinct.

The biggest problem with that, Sean, is that the callsigns used by CB'ers are not unique - there can be dozens of people using the exact same SSB numbers or AM handle. For example, if you wanted to get in touch with "713," it would be very dificult to figure out which "713."

However, in the case of the ham callsign, each callsign is unique - there is nobody else using the exact same callsign on the ham bands.

By the way, the numbers 7 and 13 are very common numbers used in callsigns (713, 137, 007, Charlie 7, Whiskey 13, etc.). A bit of trivia for your entertainment.

I bought two Maxon 40-channel, 4-watt handheld radios from Wal-Mart. With
the "rubber ducky" antenna, they had an effective transmit range of about
500 feet.
```

The literature included had an order form for the better telescoping antenna, but since these units were such poor performers out of the box, I returned them. I've seen better CB range from the children's CH14 walkie-talkies.

I had a Radio Shack TRC-201 once, 3 channel, 2 watt. I could get about 8 miles out of it. It had a telescoping antenna about 4 feet long.

I now have a couple of Motorola Talkabout 250s. They get about 1.5 miles from inside the truck to the kitchen. 14 channels, 38 anti-chatter codes, scan and keylock, 3 AA batteries. I love 'em.

> I see a radio seller's page that gives the unit a range of "100 feet to

It is not necessary to email your response to me. Are you afraid I wouldn't
see your posting? I was trying to keep it simple for the newbie. If you would
like to type/post a book on antenna theory, go for it!

Mr. Wilcox and I have talked now about the time lag on e-bay. He had things
that needed to attend to that was more important than silly e-bay. This was
my first time to use ebay and I got nervous, hearing about all the horror
stories and scams. The problem is that with my sarcasm I have scandeled a
honest person. I apologize for any damage done, any nobody should have any
hesitations about bidding on any of Mr. Wilcox's auctions.

  Now, isn't that sweet.  Happy "gobble gobble day" to you also.  By the
way, isn't Thanksgiving one word?

Actually, many are simply using that (digits left off to save space) as an excuse. In reality, I don't think many of them, just like many of us, even thought about it.

When many of these programmers were writing this code, they were concerned about it working right then (that week, that month, that year). They were not even thinking that far down the road to worry about the turn of the century. Now that applies to those who were programming twenty years ago and those programming two years ago.

It was only recently that the turn of the century made it into our collective consciousness on a higher level. And it was only then that programmers started thinking about the effects of that century change on their software.

Now, not all of this can be blamed totally on the programmers. In many cases, the programmers thought they would still be employed in the future, so felt they could address any problems as they came along (software updates, new verisons, etc).

However, many employers dumped those old programmers when they started demanding more money to continue to work on these programs (the programmers had the nerve to think they should share some of the profits of these seccessful programs). When these programmers left, much of the knowledge of the programming within these programs went with them. Now, these same employers are paying for their short sightedness (well, actually their customers are paying).

The same with government computers. The military, for example, hired programmers to write a specific program to do a specific job. When that program was finished, they saw no reason to keep the programmers around. They, like many employers, simply never understood that a program is

not ever completely finished (there is always some new issue that will
have to be addressed in the future - new hardware, new conditions, new
requirements, or even a new date).

Programmers will not make the Y2K mistake again. However, there will
always be situations where new changes will cause problems for existing
software. Perhaps companies in the future will get better at dealing
with this.

Has anyone had a Radio Shack HTX-10, 10 meter mobile radio apart?

What PLL/Controller Chip is in it?

Is it similar to the old Radio Shack TRC-485 and the Copper/Eagle Sidewinder 400? These two radios have physically similar PLL/Controller chips with slightly different different usage's (11 meter vs. 10/11 meter) burned into them (different suffix coding).

Not to worry, Dwight ... Dave Heil never has anything worth
listening to to say so you can ignore at least half of it. Dave Hall,
I haven't read yet, so I'll reserve judgement on him :-)

Does anybody know who or what company makes this radio for the "shack"??? It seems like a good deal and I've heard one on the air but is it modifiable to 11 meters????? Seems like it would be easy. It's only $139 right now!!!!

```
Thanks

New info Today 11/23, I had the squelch up all the way and still heard
noise.I've never had a radio that I had to turn the squelch up more than 1/3
of the total range. The radio has a lot of noise...anyone have any
ideas?????????

well they are deffinetly smok'n units. i have had the m-40, 80, 200, and the 400..
but they are alittle hard to get a hold of, and it usually takes a while. they lak in pr work but they are deffinetly good boxes and priced right too. looking to upgrade to a m-600 now..
my 2 cents.

Takes a man to admit when he has made a mistake. It's also free, and you feel a lot better after it's done! Stop by and take that tech a nice lunch one day before Christmas. He won't turn a nice lunch down.
<><><><><><><><><><><><><><><><>

I want to take this post to apologize to all the techs on this group. I took your advice and took my saturn to my local tech here in wash state. I was amazed at watching him find the main problem whitch was a cracked edge of main board splitting a trace. He fixed it along with some other hack jobs he said

were typical of do it your self mod book techs. He showed me around the inside of the radio and tuned it up and took care of bad mod job and week solder joints. All this right on the spot at the same time he had 3 truckers come in with varios other radio problems and he fixed them all as they waited. To top it all off he only charged me
65.00. well worth the work done.

I stand corrected on my past comments. You techs are a needed and greatly appreciated bunch. If not for techs I would be talking on my old radio again.

Also I gave tech an extra 10.00 as a tip for fast work and he woulnt take it.

again sorry all.....
Have a happy thanksgiving.
From the now tech loving happy saturn owner.

By a real radio I take it you mean some sort of "name brand" thousand dollar plus amateur radio? No I don't want to discuss the ubiquitous "used for half price" non existent ones always brought up in these discussions either.
Is there any particular reason why this radio is not good, or is it the basic coin flip type of opinion I'm getting here?

Radio Shack did indeed sell a CB called I think the TRC-485 that looks
EXACTLY like the HTX-10. In fact, promotional literature shows them
to be almost identical, with the exception that the HTX-10 had a 10M
frequency on the display, and the TRC-485 had channel 40 frequency
with a '40' on the side.

Speculation is the TRC-485 was manufactured in 'international' versions,
by Hyundai I think, for various vendors, in differnet frequency ranges
and modes,
including FM for european markets. All that really happened is the
engineers put the verious 'all together' for a 10M radio, which, by the
way, is offered by various vendors under various names.

I believe that YOU have taken my comments out of context. Your paranoia
is very evident. My second paragraph was merely stating that many of us
(myself included), are not opposed to creating new band segments to NEW
and different voice or data modes that are more in line with modern
communications techniques, at the expense of older, less used modes. I
am very much in favor of ham radio PROGRESSING. If we can prove to the
FCC that we are progressing, there will be less incentive to just shut
the service down.

Let's see if I've got you straight here. You say that *I'M* out of
touch with reality because I favor technical advancement for ham radio,
rather than stagnation by continuing to emphasize archaic modes? You
would prefer that we all go to our early ham graves (Metaphorically
speaking) clutching our CW keys, screaming "CW forever!", rather than
attempt to save ham radio by modernizing it? That is simply an illogical
position, which further proves that your arguement is based mostly on
emotion, and not on any relative facts.

That logic is reminiscent of the same protectionist logic that horse
traders used when Henry Ford started making cars.

Then prove me wrong. Otherwise, it's just your OPINION, and it holds no
more credibility than mine.

> Lawless idiots, both within and outside are much more the primary source.

This problem transcends radio hobbies, into society in general. Ham radio is just a mirror to the greater moral decline that has been propagated by our "liberal" thinking "scholar" types, rather than good old fashioned Godly values.

> So Dave - "Sandbagger", what advanced digital modes are you
> set up[to use right? SSB, on 27 mhz??

Ad Hominem.. You're predictable if nothing else......

As for digital modes, I'm ready to start playing in the digital sandbox just as soon as I find other people of like interest. It's no fun talking to myself.

>
> Well clearly you really ARE stupid

Another blatent character assassination attempt. I'm beginning to see that you have no real substantive points to make with regard to the topic. You're main defense is to attack the character of your opponent. Not a very effective debate technique. It certainly won't endear you to those on either side of the arguement.

>

No, YOU are wrong. Plain and simple. Take a poll on rec.radio.cb, and find out for yourself why most of these guys would rather stay on 27 Mhz, rather than take the ham test. I did, and I was surprized, to say the least.

There is already a simple to get no-code license. These CBers that you fear so vehemently, have the chance, but they don't take it. Why? Because in almost every case, that's been posted on here, they reply that they don't like the stuffy, arrogant, condescending personality that the hams that they encounter, display. To put it more simply, there is no fun there for them. This may all be well and good , since ham radio doesn't need people with no respect for rules and proper operating. But there are some really talented CBers, that would make great hams, except that they can't deal with the ATTITUDE. But it's not the code that's keeping them away. Code isn't REALLY that hard to learn (Even I did it with the "Wayne Green" method) for someone that wants to use it. But it is an unnecessary stumbling block, for someone who has no desire. A better testing alternative would be a more comprehensive THEORY test. At least the theory can be applied to each and every facet of ham radio. That way maybe we'll get more intelligent radio techies, interested in jump starting ham radio back into the forefront of technology, rather than a bunch of 20 WPM appliance operators, who can't solder a mike plug, or coax connector.

> > The real reason is that CBers consider hams to be stuffy, arrogant,

I have just about said all that I will say to you. You continually throw in Ad Hominem comments, and unfounded assumptions, that you can neither prove, or that relate to the subject at hand. Some of your comments border on libel which, under different circumstances, could turn into a financial burden for you. You have not learned to THINK before engaging your mouth (or fingers), and make blanket generalizations. Unless you can keep your comments restricted to the topic, without taking jabs at your opponent (which is usually the tactic of the losing side), you stand no chance of convincing anyone of the few merits that your points bring. But this is typical for a topic such as this, which is based mostly on emotion, and not on fact.....

Dave

That is STILL not a good enough reason to FORCE EVERYONE to learn it. I can get by just fine on ham radio without EVER needing or wanting a code key, so why shouldn't others, who also have no interest in code, be forced to learn it? If you get the urge to try it, and you learn it on your own because you WANT to, then that's great.

Kids still use to tin cups and a string to communicate (If daddy hasn't bought them cell phones yet), but it is far from the most effective communications mode. There is very little reason why CW is used over voice, except personal (emotional) attachment. In most cases, there is nothing that can be done on CW, that can't be sent on voice or digital, faster, and more reliably. There are very few daily cases, where CW ops are on CW because voice wouldn't work. They are there because they WANT to be there. Because CW proponents love, cherish, and worship their mode, is no reason to force the rest of us to learn it.

Well, you guys will be getting break for a while from me. I am in the
proces of moving. The computer will be packed away, and I will be taking
down antennas, and will be "off the key" for about a week.

Maybe this will all settle down to a dull roar by then, but I doubt it.
This debate has been going on for as long as I've been licensed.

Please don't misconstrue my comments as "trashing" the emergency communications aspect of ham radio. RIGHT NOW, we serve as an effective backup for commercial systems that are normally in place, and we, for the most part, do an effective job.

My point was that, at some point in our future, these commercial systems will evolve to the point that they will be reliable enough that ham backups will no longer be necessary in all but the most extreme scenarios (Asteroid impact ;)). As the emergency function of ham radio starts to shrink, the service will need a new reason to justify its existance, if we hope to compete for valuable RF spectrum.

Ok, I'll admit that my using the phrase "into the 21st century" is a bit cliche, and does not entirely capture the true meaning of my point.

This is about choice, and what is truly the direction that we want ham radio to go.

Part of what decides our future, is perception. Perception by people in power, but are not necessarily in tune with the nuts and bolts of our hobby. To an outsider, ham radio, looks like "ye old wireless" museum (People have commented this to me already). If we continue to EMPHASIZE something that's as old as the last century, then it becomes hard for this person to rationalize keeping this service alive when modern commercial companies propose using ham freqs to setup Voice/Video/data links that can enable you to be in constant contact with whatever you want, wherever you go, in real time, etc etc etc......

But, on the other hand, we "modernize" ham radio, by at least TRYING to embrace the same technologies that the commercial companies use (Can you imagine the bandwidth savings if we converted 2 meters from FM to the same digital scheme that Nextel uses for their phone/2ways?). Digital technology also offers a way to code ID's which would make speaking them every 10 minutes, superfluous, and would make it more difficult for jammers to cause havoc. "PL" takes on a whole new meaning when you kick in a rotating DSC encryption algorithm. Jammers will not even HEAR you, let alone disrupt you.

But even so, you would still have the CHOICE of using old fashioned CW (or SSB) if you desire. You should not be forced to cross the CW bridge unless you WANT to.

Because it is antique. It has outlived its usefulness. It's primary appeal, today is as a novelty mode, for people who ENJOY it, but do not necessarily NEED it.

I personally have nothing against people USING CW, as long as they don't feel that "everyone has to do it because *I* did".

For something to survive, it needs to adapt, evolve, and keep ever aware of coming changes in its environment. If something refuses to move ahead, then it becomes stagnant, and will soon wither.

Ham radio is stagnant. For the most part, the people there are appliance operators (I'm guilty too in some respects. I operate "store bought radios", even if I built the repeater). They are still using the same modes as they were 50 years ago. Yes, there have been some "enhancements" in radio technology, which make it possible to hear better than years ago. But the building blocks are still the same.

How much longer are we expected to continue with old traditions? When do we finally say goodbye and move on?

I know plenty of people who own, ride, and maintain horses. They are fun to ride, they are nostalgic, romantic, and less stressful. But none of these people ride their horses to work, or on the freeways.

So the choice becomes:

Do we maintain ham radio at status quo, for the people who hold many years of fond memories. A place where time stands still, and remains at the same relative technology level?

Do we recognize the contributions of the many facets of ham radio, but strive to embrace new and more diverse technologies and modes, that will become the building blocks for our radio and data needs "into the 21st century" and beyond?

Growth = New modes and technologies.

Stagnation = Preserving "the old".

So tell me which is better for ham radio for the long term?

Absolutely right. Please, don't think for a minute that I am downplaying
the very REAL Y2K computer problems. What I was downplaying was all the
generated media hype, surrounding the alleged fallout from this
relatively simple(Not simple to fix, but simple in nature) computer
problem (Airplanes falling from the sky, electric going off, elevators
stopping, traffic lights turning blue, etc...). I shake my head at how
easy it is for people to buy into this hype, and to set them up to be
scammed by clever people offering to "Y2K proof" your home, car, office,
whatever. In many cases, what they sell is legitimate, but would
probably not be necessary, had it not been for the hype. There are a few
companies selling battery, solar, wind and gasoline generator power
sources, for the alleged long term power grid outage. These are all fine
products in their own right. But many people will be very pissed that
they spent all of the money to create this "self sufficiency", when the
power grid never goes down, or is down for only a few hours.

> Any computer system that is super important - is already fixed. People
> are making a buck off the hype more than anything else.

Exactly! My company has tested all of its systems for Y2K (and other
sensitive dates), and we're clean. But they're going to pay me a $1000
bonus to work over the new years transition, for any unplanned problems.
So Y2K will be profitable for me as well.....

I am paying attention. You were a bit ambiguous in your assignment of "they". We had been talking about Cbers, which then got changed to HAARP. But in your last reply, it was unclear if you were still refering to the HAARP engineers (Which are in Alaska, not Fort Collins), or the "loud and proud" CBers that we were originally talking about.

No matter, my original point is still valid. CBer's cannot create their own DX conditions.

Sounds like a keeper. Your tech sounds like an honest straight-up guy.
Someone you will want to stay on good terms with. There are a bunch of
good guys like that out there, amidst a sea of "wannabees". The best
homage that you could pay to this guy is to recommend him to all of your
friends. Send work his way, and he may be kind enough to cut you a break
off of your work, or might teach you a few "secrets".

Dave

I am looking at an amp that runs one 8950 driving three
other 8950's.

I know that the 8950 tubes are priced out of sight but am
told that with a filament change from 12v to 6.3v the Svetlana
6KG6A/EL509 is a direct replacement. True?

If more than the filament voltage needs to be changed, what are
the other changes, please?

What sort of average peak SSB output should I expect? Not
momentary whistle or shout swing but solid voice output power?

I am also told that the 6KG6A/EL509 tubes run about $20. each,
anyone have a better source if I buy 4 or 8 at a time?

- Thanks! DavidC

That is exactly what IM saying! And if they are busy and still filling
orders they are throwing rush jobs out the door is that what you want?

.6 Of the top of my head. But double check. I use 9913 and it is .8 Hope
this helps.
